00786
00787     The routine writes the values of the setup parameters.
00788     We should do this better. (JV, 21-may-2008)
00789     The way it should be done is:
00790     a: write the raw values.
00791     b: give readjusted values.
00792     c: give derived values.
00793     Because this is a difficult subject, it would be nice to have a LaTeX
00794     document that explains this all exactly. There should then be a
00795     mechanism to poke the values of the setup into the LaTeX document.
00796     probably the easiest way is to make a file with lots of \def definitions
00797     and have that included into the LaTeX file.

4.126.1 Detailed Description

The functions for smart pattern searches in combinations of functions. When many wildcards are involved and the functions are (anti)symmetric an exhaustive search for all possibilities may take very much time (like factorial in the number of wildcards) while a human can often see immediately that there cannot be a match. The routines here try to make FORM a bit smarter in this respect.

This is just the beginning. It still needs lots of work!

00046 #[] StudyPattern :
00047
00048 Argument is a complete lhs of an id-statement
00049 Its last word is a zero (new convention(18-may-1997)) to indicate
00050 that no extra information is following. We can add there information
00051 about the pattern that will help during the actual pattern matching.
00052 Currently the WorkPointer points to just after this lhs.
00053
00054 Task of this routine: To study the functions, their symmetry properties
00055 and their wildcards to determine in which order the functions can
00056 be matched best. If the order should be different we can change it here.
00057
00058 Problem encountered 22-dec-2008 (JV): we don't take noncommuting
00059 functions into account.

4.128.1 Detailed Description

Contains the sort routines. We distinguish levels of sorting. The ground level is the sorting of terms in an expression. When a term has functions, the arguments can contain terms that need sorting, which this then done by raising the level. This can happen recursively. NewSort and EndSort automatically raise and lower the level. Because the ground level does some special things, sometimes we have to raise immediately to the second level skipping the ground level.

Special routines for the parallel sorting are in the file [threads.c](#). Also the sorting of terms in polynomials is special but most of that is controlled by changing the address of the compare routine. Other routines relevant for adding rational polynomials are in the file [polynito.c](#).

Definition in file [sort.c](#).

4.128.2 Macro Definition Documentation

4.128.2.1 NEWSPLITMERGE

```
#define NEWSPLITMERGE
```

4.128.3 Function Documentation

4.128.3.1 HumanString()

```
void HumanString (
    char * string,
    float input,
    const char suffix[HUMANSUFFLEN][4] )
```

Definition at line 95 of file [sort.c](#).

4.128.3.2 WriteStats()

```
void WriteStats (
    POSITION * plspace,
    WORD par,
    WORD checkLogType )
```

Writes the statistics.

Parameters

<i>plspace</i>	The size in bytes currently occupied
<i>par</i>	par = 0 = STATSSPLITMERGE after a splitmerge. par = 1 = STATSMERGETOFILE after merge to sortfile. par = 2 = STATSPOSTSORT after the sort
<i>checkLogType</i>	== CHECKLOGTYPE: The output should not go to the log file if AM.LogType is 1.

current expression is to be found in AR.CurExpr. terms are in S->TermsLeft. S->GenTerms.

Definition at line 127 of file [sort.c](#).

References [TimeCPU\(\)](#), and [TimeWallClock\(\)](#).

Referenced by [EndSort\(\)](#), [PF_Processor\(\)](#), and [StoreTerm\(\)](#).

Here is the call graph for this function:

4.128.3.3 NewSort()

```
int NewSort (
    PHEAD0 )
```

Starts a new sort. At the lowest level this is a 'main sort' with the struct according to the parameters in `S0`. At higher levels this is a sort for functions, subroutines or dollars. We prepare the arrays and structs.

Returns

Regular convention (OK -> 0)

Definition at line 649 of file [sort.c](#).

    int par )
```

Finishes a sort. At `AR.sLevel == 0` the output is to the regular output stream. When `AR.sLevel > 0`, the parameter `par` determines the actual output. The `AR.sLevel` will be popped. All ongoing stages are finished and if the sortfile is open it is closed. The statistics are printed when `AR.sLevel == 0` `par == 0` [Output](#) to the buffer. `par == 1` Sort for function arguments. The output will be copied into the buffer. It is assumed that this is in the `WorkSpace`. `par == 2` Sort for `$-variable`. We return the address of the buffer that contains the output in `buffer` (treated like `WORD **`). We first catch the output in a file (unless we can intercept things after the small buffer has been sorted) Then we read from the file into a buffer. Only when `par == 0` data compression can be attempted at `AT.SS==AT.S0`.

Parameters

<i>buffer</i>	buffer for output when needed
<i>par</i>	See above

Returns

If negative: error. If positive: number of words in output.

Definition at line 745 of file [sort.c](#).

References [ComPress\(\)](#), [FlushOut\(\)](#), [MergePatches\(\)](#), [PF_EndSort\(\)](#), [PutOut\(\)](#), [SplitMerge\(\)](#), [StageSort\(\)](#), and [WriteStats\(\)](#).

Here is the call graph for this function:

4.128.3.5 PutIn()

```

LONG PutIn (
    FILEHANDLE * file,
    POSITION * position,
    WORD * buffer,
    WORD ** take,
    int npat )
  
```

Reads a new patch from position in file handle. It is put at buffer, anything after take is moved forward. This would be part of a term that hasn't been used yet. Because of this there should be some space before the start of the buffer

Parameters

<i>file</i>	The file system from which to read
<i>position</i>	The position from which to read
<i>buffer</i>	The buffer into which to read
<i>take</i>	The unused tail should be moved before the buffer
<i>npat</i>	The number of the patch. Is needed if the information was compressed with gzip, because each patch has its own independent gzip encoding.

Definition at line 1324 of file [sort.c](#).

References [FiLe::handle](#).

Referenced by [MergePatches\(\)](#).

4.128.3.6 Sflush()

```
int Sflush (
    FILEHANDLE * fi )
```

Puts the contents of a buffer to output Only to be used when there is a single patch in the large buffer.

Parameters

<i>fi</i>	The filesystem (or its cache) to which the patch should be written
-----------	--

Definition at line 1384 of file [sort.c](#).

References [FiLe::handle](#).

Referenced by [MergePatches\(\)](#).

4.128.3.7 PutOut()

```
WORD PutOut (
    PHEAD WORD * term,
    POSITION * position,
    FILEHANDLE * fi,
    WORD ncomp )
```

Routine writes one term to file handle at position. It returns the new value of the position.

NOTE: For 'final output' we may have to index the brackets. See the struct BRACKETINDEX. We should maintain:
 1: a list with brackets array with the brackets
 2: a list of objects of type BRACKETINDEX. It contains array with either pointers or offsets to the list of brackets. starting positions in the file. The index may be tied to a maximum size. In that case we may have to prune the list occasionally.

Parameters

<i>term</i>	The term to be written
<i>position</i>	The position in the file. Afterwards it is updated
<i>fi</i>	The file (or its cache) to which should be written
<i>ncomp</i>	Information about what type of compression should be used

Definition at line 1470 of file [sort.c](#).

References [FiLe::handle](#), and [PF_ISendSbuf\(\)](#).

Referenced by [EndSort\(\)](#), [generate_expression\(\)](#), [MergePatches\(\)](#), [PF_EndSort\(\)](#), [PF_Processor\(\)](#), and [Processor\(\)](#).

Here is the call graph for this function:

4.128.3.8 FlushOut()

```
int FlushOut (
    POSITION * position,
    FILEHANDLE * fi,
    int compr )
```

Completes output to an output file and writes the trailing zero.

Parameters

<i>position</i>	The position in the file after writing
<i>fi</i>	The file (or its cache)
<i>compr</i>	Indicates whether there should be compression with gzip.

Returns

Regular conventions (OK -> 0).

Definition at line 1832 of file [sort.c](#).

References [FiLe::handle](#), [BrAcKeTiNfO::indexbuffer](#), and [PF_ISendSbuf\(\)](#).

Referenced by [EndSort\(\)](#), [MergePatches\(\)](#), [PF_EndSort\(\)](#), and [Processor\(\)](#).

Here is the call graph for this function:

4.128.3.9 AddCoef()

```
int AddCoef (
    PHEAD WORD ** ps1,
    WORD ** ps2 )
```

Adds the coefficients of the terms *ps1 and *ps2. The problem comes when there is not enough space for a new longer coefficient. First a local solution is tried. If this is not successful we need to move terms around. The possibility of a garbage collection should not be ignored, as avoiding this costs very much extra space which is nearly wasted otherwise.

If the return value is zero the terms cancelled.

The resulting term is left in *ps1.

Definition at line 2046 of file [sort.c](#).

References [GarbHand\(\)](#), and [NormalModulus\(\)](#).

Referenced by [SplitMerge\(\)](#).

Here is the call graph for this function:

4.128.3.10 AddPoly()

```
int AddPoly (
    PHEAD WORD ** ps1,
    WORD ** ps2 )
```

Routine should be called when `S->PolyWise != 0`. It points then to the position of `AR.PolyFun` in both terms.

We add the contents of the arguments of the two polynomials. Special attention has to be given to special arguments. We have to reserve a space equal to the size of one term + the size of the argument of the other. The addition has to be done in this routine because not all objects are reentrant.

Newer addition (12-nov-2007). The `PolyFun` can have two arguments. In that case `S->PolyFlag` is 2 and we have to call the routine for adding rational polynomials. We have to be rather careful what happens with: The location of the output The order of the terms in the arguments At first we allow only univariate polynomials in the `PolyFun`. This restriction will be lifted a.s.a.p.

Parameters

<i>ps1</i>	A pointer to the position of the first term
<i>ps2</i>	A pointer to the position of the second term

Returns

If zero the terms cancel. Otherwise the new term is in *ps1.

Definition at line 2175 of file [sort.c](#).

References [AddArgs\(\)](#), [GarbHand\(\)](#), and [poly_ratfun_add\(\)](#).

Referenced by [SplitMerge\(\)](#).

Here is the call graph for this function:

4.128.3.11 AddArgs()

```
void AddArgs (
    PHEAD WORD * s1,
    WORD * s2,
    WORD * m )
```

Adds the arguments of two occurrences of the PolyFun.

Parameters

<i>s1</i>	Pointer to the first occurrence.
<i>s2</i>	Pointer to the second occurrence.
<i>m</i>	Pointer to where the answer should be.

Definition at line 2347 of file [sort.c](#).

Referenced by [AddPoly\(\)](#), and [MergePatches\(\)](#).

4.128.3.12 Compare1()

```
WORD Compare1 (
    PHEAD WORD * term1,
    WORD * term2,
    WORD level )
```

Compares two terms. The answer is: 0 equal (with exception of the coefficient if level == 0.) >0 term1 comes first. <0 term2 comes first. Some special precautions may be needed to keep the CompCoef routine from generating overflows, although this is very unlikely in subterms. This routine should not return an error condition.

Originally this routine was called Compare. With the treatment of special polynomials with terms that contain only symbols and the need for extreme speed for the polynomial routines we made a special compare routine and now we store the address of the current compare routine in AR.CompareRoutine and have a macro Compare which makes all existing code work properly and we can just replace the routine on a thread by thread basis (each thread has its own AR struct).

Parameters

<i>term1</i>	First input term
<i>term2</i>	Second input term
<i>level</i>	The sorting level (may influence on the result)

Returns

0 equal (with exception of the coefficient if level == 0.) >0 term1 comes first. <0 term2 comes first.

When there are floating point numbers active (float_ = FLOATFUN) the presence of one or more float_ functions is returned in AT.SortFloatMode: 0: no float_ 1: float_ in term1 only 2: float_ in term2 only 3: float_ in both terms

Definition at line [2640](#) of file [sort.c](#).

References [CompCoef\(\)](#).

Referenced by [InFunction\(\)](#), [poly_sort\(\)](#), and [StartVariables\(\)](#).

Here is the call graph for this function:

4.128.3.13 CompareSymbols()

```
WORD CompareSymbols (
    PHEAD WORD * term1,
    WORD * term2,
    WORD par )
```

Compares the terms, based on the value of AN.polysortflag. If $\text{term1} < \text{term2}$ the return value is -1 If $\text{term1} > \text{term2}$ the return value is 1 If $\text{term1} = \text{term2}$ the return value is 0 The coefficients may differ. The terms contain only a single subterm of type SYMBOL. If AN.polysortflag = 0 it is a 'regular' compare. If AN.polysortflag = 1 the sum of the powers is more important par is a dummy parameter to make the parameter field identical to that of Compare1 which is the regular compare routine in [sort.c](#)

Definition at line 3110 of file [sort.c](#).

Referenced by [InFunction\(\)](#), and [poly_sort\(\)](#).

4.128.3.14 CompareHSymbols()

```
WORD CompareHSymbols (
    PHEAD WORD * term1,
    WORD * term2,
    WORD par )
```

Compares terms that can have only SYMBOL and HAAKJE subterms. If $\text{term1} < \text{term2}$ the return value is -1 If $\text{term1} > \text{term2}$ the return value is 1 If $\text{term1} = \text{term2}$ the return value is 0 par is a dummy parameter to make the parameter field identical to that of Compare1 which is the regular compare routine in [sort.c](#)

Definition at line 3153 of file [sort.c](#).

4.128.3.15 ComPress()

```
LONG ComPress (
    WORD ** ss,
    LONG * n )
```

Gets a list of pointers to terms and compresses the terms. In n it collects the number of terms and the return value of the function is the space that is occupied.

We have to pay some special attention to the compression of terms with a PolyFun. This PolyFun should occur only straight before the coefficient, so we can use the same trick as for the coefficient to sabotage compression of this object (Replace in the history the function pointer by zero. This is safe, because terms that would be identical otherwise would have been added).

Parameters

<i>ss</i>	Array of pointers to terms to be compressed.
<i>n</i>	Number of pointers in ss.

Returns

Total number of words needed for the compressed result.

Definition at line 3206 of file [sort.c](#).

Referenced by [EndSort\(\)](#), and [StoreTerm\(\)](#).

4.128.3.16 SplitMerge()

```
LONG SplitMerge (
    PHEAD WORD ** Pointer,
    LONG number )
```

Algorithm by J.A.M.Vermaseren (31-7-1988)

Note that AN.SplitScratch and AN.InScratch are used also in GarbHand

Merge sort in memory. The input is an array of pointers. Sorting is done recursively by dividing the array in two equal parts and calling SplitMerge for each. When the parts are small enough we can do the compare and take the appropriate action. An addition is that we look for 'runs'. Sequences that are already ordered. This happens a lot when there is very little action in a module. This made FORM faster by a few percent.

Parameters

<i>Pointer</i>	The array of pointers to the terms to be sorted.
<i>number</i>	The number of pointers in Pointer.

The terms are supposed to be sitting in the small buffer and there is supposed to be an extension to this buffer for when there are two terms that should be added and the result takes more space than each of the original terms. The notation guarantees that the result never needs more space than the sum of the spaces of the original terms.

Definition at line 3372 of file [sort.c](#).

References [AddCoef\(\)](#), [AddPoly\(\)](#), and [SplitMerge\(\)](#).

Referenced by [EndSort\(\)](#), [SplitMerge\(\)](#), and [StoreTerm\(\)](#).

Here is the call graph for this function:

4.128.3.17 GarbHand()

```
void GarbHand (
    void )
```

Garbage collection that takes place when the small extension is full and we need to place more terms there. When this is the case there are many holes in the small buffer and the whole can be compactified. The major complication is the buffer for SplitMerge. There are two options for temporary memory: 1: find some buffer that has enough space (maybe in the large buffer). 2: allocate a buffer. Give it back afterwards of course. If the small extension is properly dimensioned this routine should be called very rarely. Most of the time it will be called when the polyfun or polyratfun is active.

Definition at line 3652 of file [sort.c](#).

Referenced by [AddCoef\(\)](#), and [AddPoly\(\)](#).

4.128.3.18 MergePatches()

```
int MergePatches (
    WORD par )
```

The general merge routine. Can be used for the large buffer and the file merging. The array S->Patches tells where the patches start S->pStop tells where they end (has to be computed first). The end of a 'line to be merged' is indicated by a zero. If the end is reached without running into a zero or a term runs over the boundary of a patch it is a file merging operation and a new piece from the file is read in.

Parameters

<i>par</i>	If <i>par</i> == 0 the sort is for file -> outputfile. If <i>par</i> == 1 the sort is for large buffer -> sortfile. If <i>par</i> == 2 the sort is for large buffer -> outputfile.

Referenced by [EndSort\(\)](#), and [StoreTerm\(\)](#).

Here is the call graph for this function:

4.128.3.19 StoreTerm()

```
int StoreTerm (
    PHEAD WORD * term )
```

The central routine to accept terms, store them and keep things at least partially sorted. A call to EndSort will then complete storing and sorting.

Parameters

<i>term</i>	The term to be stored
-------------	-----------------------

Returns

Regular return conventions (OK -> 0)

Definition at line 4550 of file [sort.c](#).

References [ComPress\(\)](#), [MergePatches\(\)](#), [SplitMerge\(\)](#), and [WriteStats\(\)](#).

Here is the call graph for this function:

4.128.3.20 StageSort()

```
void StageSort (
    FILEHANDLE * fout )
```

Prepares a stage 4 or higher sort. Stage 4 sorts occur when the sort file contains more patches than can be merged in one pass.

Definition at line 4664 of file [sort.c](#).

References [FiLe::handle](#).

Referenced by [EndSort\(\)](#), and [MergePatches\(\)](#).

4.128.3.21 SortWild()

```
int SortWild (
    WORD * w,
    WORD nw )
```

Sorts the wildcard entries in the parameter w. Double entries are removed. Full space taken is nw words. Routine serves for the reading of wildcards in the compiler. The entries come in the format: (type,4,number,0) in which the zero is reserved for the future replacement of 'number'.

Parameters

<i>w</i>	buffer with wildcard entries.
<i>nw</i>	number of wildcard entries.

Returns

Normal conventions (OK -> 0)

Definition at line [4763](#) of file [sort.c](#).

4.128.3.22 CleanUpSort()

```
void CleanUpSort (
    int num )
```

Partially or completely frees function sort buffers.

Definition at line [4856](#) of file [sort.c](#).

4.128.3.23 LowerSortLevel()

```
void LowerSortLevel (
    void )
```

Lowers the level in the sort system.

04672     There are no proper provisions for stage 4 or higher sorts
04673     for function arguments and $ variables. The reason:

```

```

04674         The current code maps out the patches, based on the size of
04675         the buffers in the FoStage4 structs, while they are used
04676         inside the S->file struct that may have far smaller buffers.
04677         By itself that might still be repairable, but it goes completely
04678         wrong when during the sort polyRatFuns have to be added and they
04679         would go into stage4 (very rare but possible).
04680         The only really correct solution would be to put FoStage4 structs
04681         in all sort levels. Messy. (JV 8-oct-2018).

4.130.1 Detailed Description

File contains the code for the spectator files and their control.

Definition in file [spectator.c](#).

4.130.2 Function Documentation

4.130.2.1 CoCreateSpectator()

```
int CoCreateSpectator (
    UBYTE * inp )
```

Definition at line 89 of file [spectator.c](#).

4.130.2.2 CoToSpectator()

```
int CoToSpectator (
    UBYTE * inp )
```

Definition at line 181 of file [spectator.c](#).

4.130.2.3 CoRemoveSpectator()

```
int CoRemoveSpectator (
    UBYTE * inp )
```

Definition at line 233 of file [spectator.c](#).

4.130.2.4 CoEmptySpectator()

```
int CoEmptySpectator (
    UBYTE * inp )
```

Definition at line 293 of file [spectator.c](#).

4.130.2.5 PutInSpectator()

```
int PutInSpectator (
    WORD * term,
    WORD specnum )
```

Definition at line 345 of file [spectator.c](#).

4.130.2.6 FlushSpectators()

```
void FlushSpectators (
    void )
```

Definition at line 402 of file [spectator.c](#).

4.130.2.7 CoCopySpectator()

```
int CoCopySpectator (
    UBYTE * inp )
```

Definition at line 459 of file [spectator.c](#).

4.130.2.8 GetFromSpectator()

```
WORD GetFromSpectator (
    WORD * term,
    WORD specnum )
```

Definition at line 601 of file [spectator.c](#).

4.130.2.9 ClearSpectators()

```
void ClearSpectators (
    WORD par )
```

Definition at line 675 of file [spectator.c](#).

00040 *   #[ Commentary :
00041
00042   We use an array of SPECTATOR structs in AM.SpectatorFiles.
00043   When a spectator is removed this leaves a hole. This means that
00044   we cannot use AM.NumSpectatorFiles but always have to scan up to
00045   AM.SizeForSpectatorFiles which is the size of the array.
00046   An element is in use when it has a name. This is the name of the
00047   expression that is associated with it. There is also the number of
00048   the expression, but because the expressions are frequently renumbered
00049   at the end of a module, we always search for the spectators by name.
00050   The expression number is only valid in the current module.
00051   During execution we use the number of the spectator.
00052
00053   The FILEHANDLE struct is borrowed from the structs for the scratch
00054   files, but we do not keep copies for all workers as with the scratch
00055   files. This brings some limitations (but saves much space). Basically
00056   the reading can only be done by one master or worker. And because
00057   we use the buffer both for writing and for reading we cannot read and
00058   write in the same module.
00059
00060   Processor can see that an expression is to be filled with a spectator
00061   because we replace the compiler buffer number in the prototype by
00062   -specnum-1. Of course, after this filling has taken place we should
00063   make sure that in the next module there is a nonnegative number there.
00064   The input is then obtained from GetFromSpectator instead from GetTerm.
00065   This needed an extra argument in ThreadsProcessor. InParallelProcessor
00066   can figure it out by itself. ParFORM still needs to be treated for this.
00067
00068   The writing is to a single buffer. Hence it needs a lock. It is possible
00069   to give all workers their own buffers (at great memory cost) and merge
00070   the results when needed. That would be friendlier on ParFORM. We ALWAYS
00071   assume that the order of the terms in the spectator file is random.
00072
```

```

00073     In the first version there is no compression in the file. This could
00074     change in later versions because both the writing and the reading are
00075     purely sequential. Brackets are not possible.
00076
00077     Currently, ParFORM allows use of spectators only in the sequential
00078     mode. The parallelization is switched off in modules containing
00079     ToSpectator or CopySpectator. Workers never create or access to
00080     spectator files. Their file handles are always -1. We leave the
00081     parallelization of modules with spectators for future work.

#define VERSIONSTR FORMNAME " " VERSIONSTR__ " (" PRODUCTIONDATE ")"
```

Definition at line 101 of file [startup.c](#).

4.132.2.6 TAKEPATH

```
#define TAKEPATH(  
    x ) if(s[1]== '=' ) {x=s+2;} else {x=*argv++;argc--;}  
)
```

Definition at line 235 of file [startup.c](#).

4.132.2.7 DEFAULTFNAMELENGTH

```
#define DEFAULTFNAMELENGTH 16
```

Definition at line 664 of file [startup.c](#).

4.132.3 Function Documentation

4.132.3.1 DoTail()

```
int DoTail (  
    int argc,  
    UBYTE ** argv )
```

Definition at line 237 of file [startup.c](#).

4.132.3.2 OpenInput()

```
int OpenInput (  
    void )
```

Definition at line 542 of file [startup.c](#).

4.132.3.3 ReserveTempFiles()

```
void ReserveTempFiles (  
    int par )
```

Definition at line 666 of file [startup.c](#).

4.132.3.4 StartVariables()

```
void StartVariables (
    void )
```

All functions (well, nearly all) are declared here.

Definition at line 905 of file [startup.c](#).

References [AddNtoC\(\)](#), [AddRHS\(\)](#), [Compare1\(\)](#), [inicbufs\(\)](#), [FuNcTiOn::name](#), [PF_BroadcastNumber\(\)](#), [PutPreVar\(\)](#), and [FuNcTiOn::symmetric](#).

Here is the call graph for this function:

**4.132.3.5 StartMore()**

```
void StartMore (
    void )
```

Definition at line 1316 of file [startup.c](#).

4.132.3.6 IniVars()

```
void IniVars (
    void )
```

Definition at line 1354 of file [startup.c](#).

4.132.3.7 main()

```
int main (
    int argc,
    char ** argv )
```

Definition at line 1661 of file [startup.c](#).

4.132.3.8 Cleanup()

```
void Cleanup (
    WORD par )
```

Definition at line 1763 of file [startup.c](#).

4.132.3.9 TerminateImpl()

```
void TerminateImpl (
    int errorcode,
    const char * file,
    int line,
    const char * function )
```

Definition at line 1852 of file [startup.c](#).

4.132.3.10 PrintDeprecation()

```
void PrintDeprecation (
    const char * feature,
    const char * issue )
```

Prints a deprecation warning for a given feature.

Parameters

<i>feature</i>	The name of the deprecated feature.
<i>issue</i>	The associated issue, e.g., "issues/700".

Definition at line 2065 of file [startup.c](#).

4.132.3.11 PrintRunningTime()

```
void PrintRunningTime (
    void )
```

Definition at line 2089 of file [startup.c](#).

4.132.3.12 GetRunningTime()

```
LONG GetRunningTime (
    void )
```

Definition at line 2130 of file [startup.c](#).

4.132.4 Variable Documentation

4.132.4.1 emptystring

```
UBYTE* emptystring = (UBYTE *)"."
```

Definition at line 660 of file [startup.c](#).

4.132.4.2 defaulttempfilename

```
UBYTE* defaulttempfilename = (UBYTE *)"xformxxx.str"
```

Definition at line 661 of file [startup.c](#).

4.133 startup.c

4.134.1 Detailed Description

Contains all functions that deal with store-files and the system independent save-files.

Definition in file [store.c](#).

4.134.2 Macro Definition Documentation

4.134.2.1 SAVEREVISION

```
#define SAVEREVISION 0x02
```

Definition at line [3953](#) of file [store.c](#).

4.134.3 Function Documentation

4.134.3.1 OpenTemp()

```
void OpenTemp (
    void )
```

Definition at line [48](#) of file [store.c](#).

4.134.3.2 SeekScratch()

```
void SeekScratch (
    FILEHANDLE * fi,
    POSITION * pos )
```

Definition at line [63](#) of file [store.c](#).

4.134.3.3 SetEndScratch()

```
void SetEndScratch (
    FILEHANDLE * f,
    POSITION * position )
```

Definition at line 74 of file [store.c](#).

4.134.3.4 SetEndHScratch()

```
void SetEndHScratch (
    FILEHANDLE * f,
    POSITION * position )
```

Definition at line 88 of file [store.c](#).

4.134.3.5 SetScratch()

```
void SetScratch (
    FILEHANDLE * f,
    POSITION * position )
```

Definition at line 114 of file [store.c](#).

4.134.3.6 RevertScratch()

```
int RevertScratch (
    void )
```

Definition at line 189 of file [store.c](#).

4.134.3.7 ResetScratch()

```
int ResetScratch (
    void )
```

Definition at line 234 of file [store.c](#).

4.134.3.8 ReadFromScratch()

```
int ReadFromScratch (
    FILEHANDLE * fi,
    POSITION * pos,
    UBYTE * buffer,
    POSITION * length )
```

Definition at line 272 of file [store.c](#).

4.134.3.9 AddToScratch()

```
int AddToScratch (
    FILEHANDLE * fi,
    POSITION * pos,
    UBYTE * buffer,
    POSITION * length,
    int withflush )
```

Definition at line 299 of file [store.c](#).

4.134.3.10 CoSave()

```
int CoSave (
    UBYTE * inp )
```

Definition at line 362 of file [store.c](#).

4.134.3.11 CoLoad()

```
int CoLoad (
    UBYTE * inp )
```

Definition at line 572 of file [store.c](#).

4.134.3.12 DeleteStore()

```
int DeleteStore (
    WORD par )
```

Definition at line 772 of file [store.c](#).

4.134.3.13 PutInStore()

```
int PutInStore (
    INDEXENTRY * ind,
    WORD num )
```

Definition at line 873 of file [store.c](#).

4.134.3.14 GetTerm()

```
WORD GetTerm (
    PHEAD WORD * term )
```

Definition at line 992 of file [store.c](#).

4.134.3.15 GetOneTerm()

```
WORD GetOneTerm (
    PHEAD WORD * term,
    FILEHANDLE * fi,
    POSITION * pos,
    int par )
```

Definition at line 1267 of file [store.c](#).

4.134.3.16 GetMoreTerms()

```
WORD GetMoreTerms (
    WORD * term )
```

Definition at line 1425 of file [store.c](#).

4.134.3.17 GetMoreFromMem()

```
int GetMoreFromMem (
    WORD * term,
    WORD ** tpo in )
```

Definition at line 1521 of file [store.c](#).

4.134.3.18 GetFromStore()

```
WORD GetFromStore (
    WORD * to,
    POSITION * position,
    RENUMBER renumber,
    WORD * InCompState,
    WORD nexpr )
```

Definition at line 1628 of file [store.c](#).

4.134.3.19 DetVars()

```
void DetVars (
    WORD * term,
    WORD par )
```

Definition at line 1829 of file [store.c](#).

4.134.3.20 ToStorage()

```
int ToStorage (
    EXPRESSIONS e,
    POSITION * length )
```

Definition at line 2016 of file [store.c](#).

4.134.3.21 NextFileIndex()

```
INDEXENTRY * NextFileIndex (
    POSITION * indexpos )
```

Definition at line 2257 of file [store.c](#).

4.134.3.22 SetFileIndex()

```
int SetFileIndex (
    void )
```

Reads the next file index and puts it into AR.StoreData.Index. TODO

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 2320 of file [store.c](#).

References [WriteStoreHeader\(\)](#).

RENUMBER GetTable (
    WORD expr,
    POSITION * position,
    WORD mode )
```

Definition at line 2825 of file [store.c](#).

4.134.3.28 CopyExpression()

```
int CopyExpression (
    FILEHANDLE * from,
    FILEHANDLE * to )
```

Definition at line 3307 of file [store.c](#).

4.134.3.29 WriteStoreHeader()

```
LONG WriteStoreHeader (
    WORD handle )
```

Writes header with information about system architecture and FORM revision to an open store file.

Called by [SetFileIndex\(\)](#).

Parameters

<i>handle</i>	specifies open file to which header will be written
---------------	---

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 3964 of file [store.c](#).

References [STOREHEADER::endianness](#), [STOREHEADER::lenLONG](#), [STOREHEADER::lenPOINTER](#), [STOREHEADER::lenPOS](#), [STOREHEADER::lenWORD](#), [STOREHEADER::maxpower](#), [STOREHEADER::sFun](#), [STOREHEADER::sInd](#), [STOREHEADER::sSym](#), [STOREHEADER::sVec](#), and [STOREHEADER::wildoffset](#).

Referenced by [SetFileIndex\(\)](#).

4.134.3.30 ReadSaveHeader()

```
int ReadSaveHeader (
    void )
```

Reads the header in the save file and sets function pointers and flags according to the information found there. Must be called before any other ReadSave... function.

Currently works only for the exchange between 32bit and 64bit machines (WORD size must be 2 or 4 bytes)!

It is called by [CoLoad\(\)](#).

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4057 of file [store.c](#).

4.134.3.31 ReadSaveIndex()

```
LONG ReadSaveIndex (
    FILEINDEX * fileind )
```

Reads a FILEINDEX from the open save file specified by AO.SaveData.Handle. Translations for adjusting endianness and data sizes are done if necessary.

Depends on the assumption that sizeof(FILEINDEX) is the same everywhere. If FILEINDEX or INDEXENTRY change, then this functions has to be adjusted.

Called by CoLoad() and FindInIndex().

Parameters

<i>fileind</i>	contains the read FILEINDEX after successful return. must point to allocated, big enough memory.
----------------	--

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4175 of file [store.c](#).

References [INFILEINDEX](#), [FiLeInDeX::next](#), [FiLeInDeX::number](#), and [FuNcTiOn::number](#).

4.134.3.32 ReadSaveVariables()

```
LONG ReadSaveVariables (
    UBYTE * buffer,
    UBYTE * top,
    LONG * size,
    LONG * outsize,
    INDEXENTRY * ind,
    LONG * stage )
```

Reads the variables from the open file specified by AO.SaveData.Handle. It reads the *size bytes and writes them to the *buffer. It is called by PutInStore().

If translation is necessary, the data might shrink or grow in size, then *size is adjusted so that the reading and writing fits into the memory from the buffer to the top. The actual number of read bytes is returned in *size, the number of written bytes is returned in *outsize.

If the *size is smaller than the actual size of the variables, this function will be called several times and needs to remember the current position in the variable structure. The parameter *stage* does this job. When [ReadSaveVariables\(\)](#) is called for the first time, this parameter should have the value -1.

The parameter *ind* is used to get the number of variables.

Parameters

<i>buffer</i>	read variables are written into this allocated memory
<i>top</i>	upper end of allocated memory
<i>size</i>	number of bytes to read. might return a smaller number of read bytes if translation was necessary
<i>outsize</i>	if translation has be done, outsize contains the number of written bytes
<i>ind</i>	pointer of INDEXENTRY for the current expression. read-only
<i>stage</i>	should be -1 for the first call, will be increased by ReadSaveVariables to memorize the position in the variable structure

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4361 of file [store.c](#).

References [InDeXeNtRy::nfunctions](#), [InDeXeNtRy::nindices](#), [InDeXeNtRy::nsymbols](#), [InDeXeNtRy::nvectors](#), and [FuNcTiOn::spec](#).

4.134.3.33 ReadSaveTerm32()

```

UBYTE * ReadSaveTerm32 (
    UBYTE * bin,
    UBYTE * binend,
    UBYTE ** bout,
    UBYTE * boutend,
    UBYTE * top,
    int terminbuf )

```

Reads a single term from the given buffer at *bin* and write the translated term back to this buffer at *bout*.

[ReadSaveTerm32\(\)](#) is currently the only instantiation of a ReadSaveTerm-function. It only deals with data that already has the correct endianness and that is resized to 32bit words but without being renumbered or translated in any other way. It uses the compress buffer [AR.CompressBuffer](#).

The function is reentrant in order to cope with nested function arguments. It is called by [ReadSaveExpression\(\)](#) and itself.

The *return value* indicates the position in the input buffer up to which the data has already been successfully processed. The parameter *bout* returns the corresponding position in the output buffer.

Parameters

<i>bin</i>	start of the input buffer
<i>binend</i>	end of the input buffer
<i>bout</i>	as input points to the beginning of the output buffer, as output points behind the already translated data in the output buffer
<i>boutend</i>	end of already decompressed data in output buffer
<i>top</i>	end of output buffer
<i>terminbuf</i>	flag whether decompressed data is already in the output buffer. used in recursive calls

Returns

pointer to the next unprocessed data in the input buffer

Definition at line [4728](#) of file [store.c](#).

References [ReadSaveTerm32\(\)](#).

Referenced by [ReadSaveExpression\(\)](#), and [ReadSaveTerm32\(\)](#).

Here is the call graph for this function:

**4.134.3.34 ReadSaveExpression()**

```

LONG ReadSaveExpression (
    UBYTE * buffer,
    UBYTE * top,
    LONG * size,
    LONG * outsize )
  
```

Reads an expression from the open file specified by `AO.SaveData.Handle`. The endianness flip and a resizing without renumbering is done in this function. Thereafter the buffer consists of chunks with a uniform maximal word size (32bit at the moment). The actual renumbering is then done by calling the function [ReadSaveTerm32\(\)](#). The result is returned in *buffer*.

If the translation at some point doesn't fit into the buffer anymore, the function returns and must be called again. In any case *size* returns the number of successfully read bytes, *outsize* returns the number of successfully written bytes, and the file will be positioned at the next byte after the successfully read data.

It is called by `PutInStore()`.

Parameters

<i>buffer</i>	output buffer, holds the (translated) expression
<i>top</i>	end of buffer
<i>size</i>	number of read bytes
<i>outsize</i>	number of written bytes

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 5138 of file [store.c](#).

References [ReadSaveTerm32\(\)](#).

Here is the call graph for this function:

02792
02793     Locates stored files and constructs the renumbering tables.
02794     They are allocated in the Workspace.
02795     First the expression data are located. The Index is treated
02796     as a circularly linked buffer which is paged forwardly.
02797     If the indexentry is located (in ind) the two renumber tables
02798     have to be constructed.
02799     Finally the prototype has to be put in the proper buffer, so
02800     that wildcards can be passed. There should be a test with
02801     an already existing prototype that is constructed by the
02802     pattern matcher. This has not been put in yet.
02803
02804     There is a problem with the parallel processing.
02805     Feeding in the variables that were erased by a .store could in
02806     principle happen in different orders (ParFORM) or simultaneously
02807     (TFORM). The proper resolution is to have the compiler call GetTable
02808     when a stored expression is encountered.
02809
02810     This has been mended in development of TFORM by reading the
02811     symbol tables during compilation. See the call to GetTable
02812     in the CodeGenerator.
02813
02814     Next is the problem of FindInIndex which writes in AR.StoreData
02815     Copying this is expensive!
02816
02817     This Doesn't work well for TFORM yet!!!!!!!
02818     e[x1,x2] versus e[x2,x1] messes up.
02819     For the rest is the reloading during execution not thread safe.
02820
02821     The parameter mode tells whether we should worry about arguments
02822     of a stored expression.

03511
03512     All functions concerned with the system independent reading of save-files
03513     are here. They are called by the functions CoLoad, PutInStore,
03514     SetFileIndex, FindInIndex. In case no translation (endianness flip,
03515     resizing of words, renumbering) has to be done, they just do simple file
03516     reading. The function SaveFileHeader() for writing a header with
03517     information about the system architecture, FORM version, etc. is also
03518     located here.

4.136.1 Detailed Description

Contains definitions for global structs.

!!!CAUTION!!! Changes in this file will most likely have consequences for the recovery mechanism (see [checkpoint.c](#)). You need to care for the code in [checkpoint.c](#) as well and modify the code there accordingly!

The marker [D] is used in comments in this file to mark pointers to which dynamically allocated memory is assigned by a call to malloc() during runtime (in contrast to pointers that point into already allocated memory). This information is especially helpful if one needs to know which pointers need to be freed (cf. [checkpoint.c](#)).

Definition in file [structs.h](#).

4.136.2 Macro Definition Documentation

4.136.2.1 INFILEINDEX

```
#define INFILEINDEX ((512-2*sizeof(POSITION))/sizeof(INDEXENTRY))
```

Maximum number of entries (struct [InDeXeNtRy](#)) in a file index (struct [FiLeInDeX](#)). Number is calculated such that the size of a file index is no more than 512 bytes.

Definition at line 118 of file [structs.h](#).

4.136.2.2 EMPTYININDEX

```
#define EMPTYININDEX (512-2*sizeof(POSITION)-INFILEINDEX*sizeof(INDEXENTRY))
```

Number of empty filling bytes for a file index (struct [FiLeInDeX](#)). It is calculated such that the size of a file index is always 512 bytes.

Definition at line 123 of file [structs.h](#).

4.136.2.3 PHEAD

```
#define PHEAD
```

Definition at line 2494 of file [structs.h](#).

4.136.2.4 PHEAD0

```
#define PHEAD0 void
```

Definition at line 2495 of file [structs.h](#).

4.136.2.5 BHEAD

```
#define BHEAD
```

Definition at line 2496 of file [structs.h](#).

4.136.2.6 BHEAD0

```
#define BHEAD0
```

Definition at line 2497 of file [structs.h](#).

4.136.3 Typedef Documentation

4.136.3.1 INDEXENTRY

```
typedef struct InDeXeNtRy INDEXENTRY
```

Defines the structure of an entry in a file index (see struct [FiLeInDeX](#)).

It represents one expression in the file.

4.136.3.2 FILEINDEX

```
typedef struct FiLeInDeX FILEINDEX
```

Defines the structure of a file index in store-files and save-files.

It contains several entries (see struct [InDeXeNtRy](#)) up to a maximum of [INFILEINDEX](#).

The variable number has been made of type POSITION to avoid padding problems with some types of computers/↔ OS and keep system independence of the .sav files.

This struct is always 512 bytes long.

4.136.3.3 VARRENUM

```
typedef struct VaRrEnUm VARRENUM
```

Contains the pointers to an array in which a binary search will be performed.

4.136.3.4 RENUMBER

```
typedef struct ReNuMbEr * RENUMBER
```

Only symb.lo gets dynamically allocated. All other pointers points into this memory.

4.136.3.5 NAMENODE

```
typedef struct NaMeNode NAMENODE
```

The names of variables are kept in an array. Elements of type [NAMENODE](#) define a tree (that is kept balanced) that make it easy and fast to look for variables. See also [NAMETREE](#).

4.136.3.6 NAMETREE

```
typedef struct NaMeTree NAMETREE
```

A struct of type [NAMETREE](#) controls a complete (balanced) tree of names for the compiler. The compiler maintains several of such trees and the system has been set up in such a way that one could define more of them if we ever want to work with local name spaces.

4.136.3.7 COMPTREE

```
typedef struct tree COMPTREE
```

The subexpressions in the compiler are kept track of in a (balanced) tree to reduce the need for subexpressions and hence save much space in large rhs expressions (like when we have xxxxxx occurrences of objects like $f(x+1, x+1)$ in which each $x+1$ becomes a subexpression. The struct that controls this tree is COMPTREE.

4.136.3.8 TABLES

```
typedef struct TaBleS * TABLES
```

buffers, mm, flags, and prototype are always dynamically allocated, tablepointers only if needed (=0 if unallocated), boomlijst and argtail only for sparse tables.

Allocation is done for both the normal and the stub instance (spare), except for prototype and argtail which share memory.

4.136.3.9 FUNCTIONS

```
typedef struct FuNcTiOn * FUNCTIONS
```

Contains all information about a function. Also used for tables. It is used in the [LIST](#) elements of AC.

4.136.3.10 FILEHANDLE

```
typedef struct File FILEHANDLE
```

The type FILEHANDLE is the struct that controls all relevant information of a file, whether it is open or not. The file may even not yet exist. There is a system of caches (PObuffer) and as long as the information to be written still fits inside the cache the file may never be created. There are variables that can store information about different types of files, like scratch files or sort files. Depending on what is available in the system we may also have information about gzip compression (currently sort file only) or locks (TFORM).

4.136.3.11 STREAM

```
typedef struct Stream STREAM
```

Input is read from 'streams' which are represented by objects of type STREAM. A stream can be a file, a do-loop, a procedure, the string value of a preprocessor variable When a new stream is opened we have to keep information about where to fall back in the parent stream to allow this to happen even in the middle of reading names etc as would be the case with a 'i'b

4.136.3.12 TRACES

```
typedef struct TrAcEs TRACES
```

The struct TRACES keeps track of the progress during the expansion of a 4-dimensional trace. Each time a term gets generated the expansion tree continues in the next statement. When it returns it has to know where to continue. The 4-dimensional traces are more complicated than the n-dimensional traces (see TRACEN) because of the extra tricks that can be used. They are responsible for the shorter final expressions.

4.136.3.13 TRACEN

```
typedef struct TrAcEn * TRACEN
```

The struct TRACEN keeps track of the progress during the expansion of a 4-dimensional trace. Each time a term gets generated the expansion tree continues in the next statement. When it returns it has to know where to continue.

4.136.3.14 PREVAR

```
typedef struct pReVaR PREVAR
```

An element of the type PREVAR is needed for each preprocessor variable.

4.136.3.15 DOLOOP

```
typedef struct DoLoOp DOLOOP
```

Each preprocessor do loop has a struct of type DOLOOP to keep track of all relevant parameters like where the beginning of the loop is, what the boundaries, increment and value of the loop parameter are, etc. Also we keep the whole loop inside a buffer of type [PRELOAD](#)

4.136.3.16 set_of_char

```
typedef struct bit_field set_of_char[32]
```

Used in set_in, set_set, set_del and set_sub.

Definition at line [931](#) of file [structs.h](#).

4.136.3.17 one_byte

```
typedef struct bit_field* one_byte
```

Used in set_in, set_set, set_del and set_sub.

Definition at line 937 of file [structs.h](#).

4.136.3.18 FINISHUFFLE

```
typedef int(* FINISHUFFLE) (WORD *)
```

Definition at line 957 of file [structs.h](#).

4.136.3.19 DO_UFFLE

```
typedef int(* DO_UFFLE) (WORD *, WORD, WORD, WORD)
```

Definition at line 958 of file [structs.h](#).

4.136.3.20 COMPAREDUMMY

```
typedef WORD(* COMPAREDUMMY) (WORD *, WORD *, WORD)
```

Definition at line 963 of file [structs.h](#).

4.136.3.21 CBUF

```
typedef struct CbUf CBUF
```

The CBUF struct is used by the compiler. It is a compiler buffer of which since version 3.0 there can be many.

4.136.3.22 CHANNEL

```
typedef struct ChAnNeL CHANNEL
```

When we read input from text files we have to remember not only their handle but also their name. This is needed for error messages. Hence we call such a file a channel and reserve a struct of type [CHANNEL](#) to allow to lay this link.

4.136.3.23 NESTING

```
typedef struct NeStInG * NESTING
```

The NESTING struct is used when we enter the argument of functions and there is the possibility that we have to change something there. Because functions can be nested we have to keep track of all levels of functions in case we have to move the outer layers to make room for a larger function argument.

4.136.3.24 STORECACHE

```
typedef struct StOrEcAcHe * STORECACHE
```

The struct of type STORECACHE is used by a caching system for reading terms from stored expressions. Each thread should have its own system of caches.

4.136.3.25 PERM

```
typedef struct PeRmUte PERM
```

The struct PERM is used to generate all permutations when the pattern matcher has to try to match (anti)symmetric functions.

4.136.3.26 PERMP

```
typedef struct PeRmUtEp PERMP
```

Like struct PERM but works with pointers.

4.136.3.27 DISTRIBUTE

```
typedef struct DiStRiBuTe DISTRIBUTE
```

The struct DISTRIBUTE is used to help the pattern matcher when matching antisymmetric tensors.

4.136.3.28 PARTI

```
typedef struct PaRtI PARTI
```

The struct PARTI is used to help determining whether a partition_ function can be replaced.

4.136.3.29 SORTING

```
typedef struct sOrT SORTING
```

The struct SORTING is used to control a sort operation. It includes a small and a large buffer and arrays for keeping track of various stages of the (merge) sorts. Each sort level has its own struct and different levels can have different sizes for its arrays. Also different threads have their own set of SORTING structs.

4.136.3.30 ALLGLOBALS

```
typedef struct AllGlobals ALLGLOBALS
```

Without pthreads (FORM) the ALLGLOBALS struct has all the global variables

4.136.3.31 WCN

```
typedef int(* WCN) ()
```

Definition at line 2504 of file [structs.h](#).

4.136.3.32 WCN2

```
typedef int(* WCN2) ()
```

Definition at line 2505 of file [structs.h](#).

4.136.3.33 COMPARE

```
typedef WORD(* COMPARE) (PHEAD WORD *, WORD *, WORD)
```

Definition at line 2508 of file [structs.h](#).

4.136.3.34 FIXEDGLOBALS

```
typedef struct FixedGlobals FIXEDGLOBALS
```

The FIXEDGLOBALS struct is an anachronism. It started as the struct with global variables that needed initialization. It contains the elements Operation and OperaFind which define a very early way of automatically jumping to the proper operation. We find the results of it in parts of the file [opera.c](#). Later operations were treated differently in a more transparent way. We never changed the existing code. The most important part is currently the cTable which is used intensively in the compiler.

4.138.1 Detailed Description

The routines that deal with the pattern matching of functions with symmetric properties.

Definition in file [symmetr.c](#).

4.138.2 Function Documentation

4.138.2.1 MatchE()

```
int MatchE (
    PHEAD WORD * pattern,
    WORD * fun,
    WORD * inter,
    WORD par )
```

Definition at line 56 of file [symmetr.c](#).

4.138.2.2 Permute()

```
int Permute (
    PERM * perm,
    WORD first )
```

Definition at line 444 of file [symmetr.c](#).

4.138.2.3 PermuteP()

```
int PermuteP (  
    PERMP * perm,  
    WORD first )
```

Definition at line 478 of file [symmetr.c](#).

4.138.2.4 Distribute()

```
int Distribute (  
    DISTRIBUTE * d,  
    WORD first )
```

Definition at line 510 of file [symmetr.c](#).

4.138.2.5 MatchCy()

```
int MatchCy (  
    PHEAD WORD * pattern,  
    WORD * fun,  
    WORD * inter,  
    WORD par )
```

Definition at line 571 of file [symmetr.c](#).

4.138.2.6 FunMatchCy()

```
int FunMatchCy (  
    PHEAD WORD * pattern,  
    WORD * fun,  
    WORD * inter,  
    WORD par )
```

Definition at line 1067 of file [symmetr.c](#).

4.138.2.7 FunMatchSy()

```
int FunMatchSy (  
    PHEAD WORD * pattern,  
    WORD * fun,  
    WORD * inter,  
    WORD par )
```

Definition at line 1525 of file [symmetr.c](#).

4.138.2.8 MatchArgument()

```
int MatchArgument (
    PHEAD WORD * arg,
    WORD * pat )
```

Definition at line 2052 of file [symmetr.c](#).

4.139 symmetr.c

00040 #[] MatchE : WORD MatchE(pattern,fun,inter,par)
00041
00042 Matches symmetric and antisymmetric tensors.
00043 Pattern and fun point at a tensor.
00044 Problem is the wildcarding and all its possible permutations.
00045 This routine loops over all of them and calls for each
00046 possible wildcarding the recursion in ScanFunctions.
00047 Note that this can be very costly.
00048
00049 Originally this routine did only Levi Civita tensors and hence
00050 it dealt only with commuting objects.
00051 Because of the backtracking we cannot fall back to the calling
00052 ScanFunctions routine and check the sequence of functions when
00053 non-commuting objects are involved.

00312     Now there are only free wildcards left.
00313     Possibly the assigned values ate too many vectors.
00314     The rest has to be done the 'hard way' via permutations.
00315     This is too bad when there are 10 indices.
00316     This could cause 10! tries.
00317     We try to avoid the worst case by using a very special
00318     (somewhat slow) permutation routine that has as its worst
00319     cases some rather unlikely configurations, rather than some
00320     common ones (as would have been the case with the conventional
00321     permutation routine).
00322     assume:
00323         vvvvvvvvvvvviiiiiii      (tvfix in tfixvec and tfix in tfixind)
00324         VVVVVVVVVVIIIIIIIII      (vwc in wcvect and iwc in wcind)
00325     Note: all further assignments are possible at this point!
00326     Strategy:
00327         permute v
00328         permute i
00329         loop over the ordered distribution of the leftover v's
00330         through the i's.

00431     The aim is to cycle through in as fast a way as possible,
00432     to take care that each object hits the various positions
00433     already early in the game.
00434
00435     Start at two: -> cycle of two
00436     then three -> cycle of three
00437     etc;
00438     The innermost cycle is the longest. This is the opposite
00439     of the usual way of generating permutations and it is
00440     certainly not the fastest one. It allows for the fastest
00441     hit in the assignment of wildcards though.

4.140.1 Detailed Description

Contains all functions that deal with the table bases on the 'FORM level' The low level database routines are in [minos.c](#)

Definition in file [tables.c](#).

4.140.2 Function Documentation

4.140.2.1 ClearTableTree()

```
void ClearTableTree (  
    TABLES T )
```

Definition at line 72 of file [tables.c](#).

4.140.2.2 InsTableTree()

```
int InsTableTree (  
    TABLES T,  
    WORD * tp )
```

Definition at line 103 of file [tables.c](#).

4.140.2.3 RedoTableTree()

```
void RedoTableTree (  
    TABLES T,  
    int newsiz )
```

Definition at line 266 of file [tables.c](#).

4.140.2.4 FindTableTree()

```
int FindTableTree (  
    TABLES T,  
    WORD * tp,  
    int inc )
```

Definition at line 291 of file [tables.c](#).

4.140.2.5 DoTableExpansion()

```
int DoTableExpansion (
    WORD * term,
    WORD level )
```

Definition at line 334 of file [tables.c](#).

4.140.2.6 CoTableBase()

```
int CoTableBase (
    UBYTE * s )
```

Definition at line 627 of file [tables.c](#).

4.140.2.7 FlipTable()

```
int FlipTable (
    FUNCTIONS f,
    int type )
```

Definition at line 671 of file [tables.c](#).

4.140.2.8 SpareTable()

```
int SpareTable (
    TABLES TT )
```

Definition at line 694 of file [tables.c](#).

4.140.2.9 FindTB()

```
DBASE * FindTB (
    UBYTE * name )
```

Definition at line 734 of file [tables.c](#).

4.140.2.10 CoTBcreate()

```
int CoTBcreate (
    UBYTE * s )
```

Definition at line 756 of file [tables.c](#).

4.140.2.11 CoTBopen()

```
int CoTBopen (
    UBYTE * s )
```

Definition at line 772 of file [tables.c](#).

4.140.2.12 CoTBaddto()

```
int CoTBaddto (
    UBYTE * s )
```

Definition at line 801 of file [tables.c](#).

4.140.2.13 CoTBenter()

```
int CoTBenter (
    UBYTE * s )
```

Definition at line 974 of file [tables.c](#).

4.140.2.14 CoTestUse()

```
int CoTestUse (
    UBYTE * s )
```

Definition at line 1133 of file [tables.c](#).

4.140.2.15 CheckTableDeclarations()

```
int CheckTableDeclarations (
    DBASE * d )
```

Definition at line 1178 of file [tables.c](#).

4.140.2.16 CoTBload()

```
int CoTBload (
    UBYTE * ss )
```

Definition at line 1252 of file [tables.c](#).

4.140.2.17 TestUse()

```
int TestUse (
    WORD * term,
    WORD level )
```

Definition at line 1414 of file [tables.c](#).

4.140.2.18 CoTBaudit()

```
int CoTBaudit (
    UBYTE * s )
```

Definition at line 1474 of file [tables.c](#).

4.140.2.19 CoTBon()

```
int CoTBon (
    UBYTE * s )
```

Definition at line 1514 of file [tables.c](#).

4.140.2.20 CoTBoff()

```
int CoTBoff (
    UBYTE * s )
```

Definition at line 1545 of file [tables.c](#).

4.140.2.21 CoTBcleanup()

```
int CoTBcleanup (
    UBYTE * s )
```

Definition at line 1576 of file [tables.c](#).

4.140.2.22 CoTBreplace()

```
int CoTBreplace (
    UBYTE * s )
```

Definition at line 1588 of file [tables.c](#).

4.140.2.23 CoTBuse()

```
int CoTBuse (
    UBYTE * s )
```

Definition at line 1603 of file [tables.c](#).

4.140.2.24 CoApply()

```
int CoApply (
    UBYTE * s )
```

Definition at line 1797 of file [tables.c](#).

4.140.2.25 CoTBhelp()

```
int CoTBhelp (
    UBYTE * s )
```

Definition at line 1884 of file [tables.c](#).

4.140.2.26 ReWorkT()

```
void ReWorkT (
    WORD * term,
    WORD * funcs,
    WORD numfuncs )
```

Definition at line 1900 of file [tables.c](#).

4.140.2.27 Apply()

```
void Apply (
    WORD * term,
    WORD level )
```

Definition at line 1981 of file [tables.c](#).

4.140.2.28 ApplyExec()

```
int ApplyExec (
    WORD * term,
    int maxtogo,
    WORD level )
```

Definition at line 2039 of file [tables.c](#).

4.140.2.29 ApplyReset()

```
void ApplyReset (
    WORD level )
```

Definition at line 2256 of file [tables.c](#).

4.140.2.30 TableReset()

```
void TableReset (
    void )
```

Definition at line 2291 of file [tables.c](#).

4.140.2.31 ReleaseTB()

```
int ReleaseTB (
    void )
```

Definition at line 2317 of file [tables.c](#).

00035 *   File contains the routines for the tree structure of sparse tables
00036 *   We insert elements by
00037 *   InsTableTree(T,tp) with T the TABLES element and tp the pointer
00038 *   to the indices.
00039 *   We look for elements with
00040 *   FindTableTree(T,tp,inc) with T the TABLES element, tp the pointer to the
00041 *   indices or the function arguments and inc tells which of these options.
00042 *   The tree is cleared with ClearTableTree(T) and we rebuild the tree
00043 *   after a .store in which we lost a part of the table with
00044 *   RedoTableTree(T,newsize)
00045 *
00046 *   In T->tablepointers we have the lists of indices for each element.
00047 *   Additionally for each element there is an extension. There are
00048 *   TABLEEXTENSION WORDs reserved for that. The old system had two words
00049 *   One for the element in the rhs of the compile buffer and one for
00050 *   an additional rhs in case the original would be overwritten by a new
00051 *   definition, but the old was fixed by .global and hence it should be possible
00052 *   to restore it.
00053 *   New use (new = 24-sep-2001)
00054 *   rhs1,numCompBuffer1,rhs2,numCompBuffer2,usage
00055 *   Hence TABLEEXTENSION will be 5. Note that for 64 bits the use of the
00056 *   compiler buffer is overdoing it a bit, but it would be too complicated
00057 *   to try to give it special code.

00565 #] DoTableExpansion :
00566 #[ TableBase :
00567
00568 File with all the database related things.
00569 We have the routines for the generic database command
00570 TableBase,options;
00571 TB,options;
00572 Options are:
00573     Open "File.tbl";           Open for R/W
00574     Open "File.tbl", readonly; Open for R
00575     Create "File.tbl";         Create for write
00576     Load "File.tbl", tablename; Loads stubs of table
00577     Load "File.tbl";           Loads stubs of all tables
00578     Enter "File.tbl", tablename; Loads whole table
00579     Enter "File.tbl";           Loads all tables
00580     Audit "File.tbl", options; Print list of contents
00581     Replace "File.tbl", tablename; Saves a table (with overwrite)
00582     Replace "File.tbl", table element; Saves a table element "
00583     Cleanup "File.tbl";        Makes tables contingent
00584     AddTo "File.tbl" tablename; Add if not yet there.
00585     AddTo "File.tbl" table element; Add if not yet there.
00586     Delete "File.tbl" tablename;
00587     Delete "File.tbl" table element;
00588
00589     On/Off substitute;
00590     On/Off compress "File.tbl";
00591     id tbl_(f?,?a) = f(?a);
00592     When a tbl_ is used, automatically the corresponding element is compiled

```

```

00593     at the start of the next module.
00594     if TB,On,substitute [tablename], use of table RHS (if loaded)
00595     if TB,Off,substitute [tablename], use of tbl_(table,...);
00596
00597
00598     Still needed: Something like OverLoad to allow loading parts of a table
00599     from more than one file. Date stamps needed? In that case we need a touch
00600     command as well.
00601
00602     If we put all our diagrams inside, we have to go outside the concept
00603     of tables.

02023
02024 Replaces occurrences of tbl_(table,indices,pattern) by the proper
02025 rhs of table(indices,pattern). It does this up to maxtogo times
02026 in the given term. It starts with the occurrences inside the
02027 arguments of functions. If necessary it finishes at groundlevel.
02028 An infinite number of tries is indicated by maxtogo = 2^15-1 or 2^31-1.
02029 The occurrences are replaced by subexpressions. This allows TestSub
02030 to finish the job properly.
02031
02032 The main trick here is T = T->spare which turns to the proper rhs.
02033
02034 The return value is the number of substitutions that can still be made
02035 based on maxtogo. Hence, if the returnvalue is different from maxtogo
02036 there was a substitution.
02037 */

4.142 threads.c File Reference

4.142.1 Detailed Description

Routines for the interface of FORM with the pthreads library

This is the main part of the parallelization of TFORM. It is important to also look in the files [structs.h](#) and [variable.h](#) because the treatment of the A and B structs is essential (these structs are used by means of the macros AM, AP, AC, AS, AR, AT, AN, AO and AX). Also the definitions and use of the macros BHEAD and PHEAD should be looked up.

The sources are set up in such a way that if WITHPTHREADS isn't defined there is no trace of pthread parallelization. The reason is that TFORM is far more memory hungry than sequential FORM.

Special attention should also go to the locks. The proper use of the locks is essential and determines whether TFORM can work at all. We use the LOCK/UNLOCK macros which are empty in the case of sequential FORM. These locks are at many places in the source files when workers can interfere with each others data or with the data of the master.

Definition in file [threads.c](#).

00427         12-jun-2007 JV:
00428         For the timing one has to know a few things:
00429         The POSIX standard is that there is only a single process ID and that
00430         getrusage returns the time of all the threads together.
00431         Under Linux there are two methods though: The older LinuxThreads and NPTL.
00432         LinuxThreads gives each thread its own process id. This makes that we
00433         can time the threads with getrusage, and hence this was done. Under NPTL
00434         this has been 'corrected' and suddenly getrusage doesn't work anymore the
00435         way it used to. Now we need
00436         clock_gettime(CLOCK_THREAD_CPUTIME_ID,&timing)
00437         which is declared in <time.h> and we need -lrt extra in the link statement.
00438         (this is at least the case on blade02 at DESY-Zeuthen).
00439         See also the code in tools.c at the routine Timer.

```

```

01801      #] DOBRACKETS :
01802
01803          In case we have a bracket index we can have the worker treat
01804          one or more of the entries in the bracket index.
01805          The advantage is that identical terms will meet each other
01806          sooner in the sorting and hence fewer compares will be needed.
01807          Also this way the master doesn't need to fill the buckets.
01808          The main problem is the load balancing which can become very
01809          bad when there is a long tail without things outside the bracket.
01810
01811          We get sent:

4.144.1 Detailed Description

The tokenizer. This is a part of the compiler that does an intermediate type of translation. It does look up the names etc and can do a number of optimizations. The resulting output is a stream of bytes which can be processed by the code generator (in the file [compiler.c](#))

Definition in file [token.c](#).

4.144.2 Macro Definition Documentation

4.144.2.1 CHECKPOLY

```
#define CHECKPOLY {if(polyflag)MesPrint("&Illegal use of polynomial function"); polyflag = 0;
}
```

Definition at line 56 of file [token.c](#).

4.144.3 Function Documentation

4.144.3.1 tokenize()

```
int tokenize (
    UBYTE * in,
    WORD leftright )
```

Definition at line 58 of file [token.c](#).

4.144.3.2 WriteTokens()

```
void WriteTokens (
    SBYTE * in )
```

Definition at line 659 of file [token.c](#).

4.144.3.3 simp1token()

```
int simp1token (
    SBYTE * s )
```

Definition at line 707 of file [token.c](#).

4.144.3.4 simpwtoken()

```
int simpwtoken (
    SBYTE * s )
```

Definition at line 796 of file [token.c](#).

4.144.3.5 simp2token()

```
int simp2token (
    SBYTE * s )
```

Definition at line 950 of file [token.c](#).

4.144.3.6 simp3atoken()

```
int simp3atoken (
    SBYTE * s,
    int mode )
```

Definition at line 1198 of file [token.c](#).

4.144.3.7 simp3btoken()

```
int simp3btoken (
    SBYTE * s,
    int mode )
```

Definition at line 1439 of file [token.c](#).

4.144.3.8 simp4token()

```
int simp4token (
    SBYTE * s )
```

Definition at line 1850 of file [token.c](#).

4.144.3.9 simp5token()

```
int simp5token (
    SBYTE * s,
    int mode )
```

Definition at line 2010 of file [token.c](#).

4.144.3.10 simp6token()

```
int simp6token (

4.146.1 Detailed Description

Low level routines for many types of task. There are routines for manipulating the input system (streams and files) routines for string manipulation, the memory allocation interface, and the clock. The last is the most sensitive to ports. In the past nearly every port to another OS or computer gave trouble. Nowadays it is slightly better but the poor POSIX compliance of LINUX again gave problems for the multithreaded version.

4.146.2 Macro Definition Documentation

4.146.2.1 FILLVALUE

```
#define FILLVALUE 0
```

Definition at line 49 of file [tools.c](#).

4.146.2.2 TERMMEMSTARTNUM

```
#define TERMMEMSTARTNUM 16
```

Provides memory for one term (or one small polynomial) This means that the memory is limited to a buffer of size AM.MaxTer plus a few extra words. In parallel versions, each worker has its own memory pool.

The way we use the memory is by: term = TermMalloc(BHEAD0); and later we free it by TermFree(BHEAD term);

Layout: We have a list of available pointers to buffers: AT.TermMemHeap Its size is AT.TermMemMax We take from the top (indicated by AT.TermMemTop). When we run out of buffers we assign new ones (doubling the amount) and we have to extend the AT.TermMemHeap array. Important: There is no checking that the returned memory is legal, ie is memory that was handed out earlier.

Definition at line 2464 of file [tools.c](#).

4.146.2.3 TERMEXTRAWORDS

```
#define TERMEXTRAWORDS 10
```

Definition at line 2465 of file [tools.c](#).

4.146.2.4 NUMBERMEMSTARTNUM

```
#define NUMBERMEMSTARTNUM 16
```

Provides memory for one Long number This means that the memory is limited to a buffer of size AM.MaxTal In parallel versions, each worker has its own memory pool.

The way we use the memory is by: num = NumberMalloc(BHEAD0); Number = AT.NumberMemHeap[num]; and later we free it by NumberFree(BHEAD num);

Layout: We have a list of available pointers to buffers: AT.NumberMemHeap Its size is AT.NumberMemMax We take from the top (indicated by AT.NumberMemTop). When we run out of buffers we assign new ones (doubling the amount) and we have to extend the AT.NumberMemHeap array. Important: There is no checking on the returned memory!!!!

4.146.2.5 NUMBEREXTRAWORDS

```
#define NUMBEREXTRAWORDS 10L
```

Definition at line 2565 of file [tools.c](#).

4.146.2.6 DODOUBLE

```
#define DODOUBLE(
    x )
```

Value:

```
{ x *s, *t, *u; if ( *start ) { \
    oldsize = *(x **)stop - *(x **)start; newsize = 2*oldsize; \
    t = u = (x *)Malloca1(newsize*sizeof(x),text); s = *(x **)start; \
    for ( i = 0; i < oldsize; i++ ) { *t++ = *s++; } M_free(*start,"double"); } \
    else { newsize = 100; u = (x *)Malloca1(newsize*sizeof(x),text); } \
    *start = (void *)u; *stop = (void *) (u+newsize); }
```

Definition at line 2887 of file [tools.c](#).

4.146.2.7 DOEXPAND

```
#define DOEXPAND(
    x )
```

Value:

```
{ x *newbuffer, *t, *m; \
    t = newbuffer = (x *)Malloca1((newsize+2)*type,"ExpandBuffer"); \
    if ( *buffer ) { m = (x *)*buffer; i = *oldsize; \
        while ( --i >= 0 ) { *t++ = *m++; } M_free(*buffer,"ExpandBuffer"); \
    } *buffer = newbuffer; *oldsize = newsize; }
```

```
int CompArg (
    WORD * s1,
    WORD * s2 )
```

Definition at line 3224 of file [tools.c](#).

4.146.3.83 TimeWallClock()

```
LONG TimeWallClock (
    WORD par )
```

Returns the wall-clock time.

Parameters

<i>par</i>	If zero, the wall-clock time will be reset to 0.
------------	--

Returns

The wall-clock time in centiseconds.

Definition at line 3394 of file [tools.c](#).

Referenced by [DoCheckpoint\(\)](#), [DoRecovery\(\)](#), [find_Horner_MCTS\(\)](#), [optimize_expression_given_Horner\(\)](#), [optimize_greedy\(\)](#), and [WriteStats\(\)](#).

```
LONG TimeChildren (
    WORD par )
```

Definition at line 3450 of file [tools.c](#).

4.146.3.85 TimeCPU()

```
LONG TimeCPU (
    WORD par )
```

Returns the CPU time.

Parameters

<i>par</i>	If zero, the CPU time will be reset to 0.
------------	---

Returns

The CPU time in milliseconds.

Definition at line 3468 of file [tools.c](#).

Referenced by [PF_GetSlaveTimes\(\)](#), [PF_Processor\(\)](#), and [WriteStats\(\)](#).

4.146.3.86 Crash()

```
int Crash (
    void )
```

Definition at line 3751 of file [tools.c](#).

4.146.3.87 TestTerm()

```
int TestTerm (
    WORD * term )
```

Tests the consistency of the term. Returns 0 when the term is OK. Any nonzero value is trouble. In the current version the testing isn't 100% complete. For instance, we don't check the validity of the symbols nor do we check the range of their powers. Etc. This should be extended when the need is there.

Parameters

<i>term</i>	the term to be tested
-------------	-----------------------

01244     #] ReadFile :
01245     #[ ReadPosFile :
01246
01247     Gets words from a file(handle).
01248     First tries to get the information from the buffers.
01249     Reads a file at a position. Updates the position.
01250     Places a lock in the case of multithreading.
01251     Exists for multiple reading from the same file.
01252     size is the number of WORDs to read!!!!
01253
01254     We may need some strategy in the caching. This routine is used from
01255     GetOneTerm only. The problem is when it reads brackets and the
01256     brackets are read backwards. This is very uneconomical because
01257     each time it may read a large buffer.
01258     On the other hand, reading piece by piece in GetOneTerm takes
01259     much overhead as well.
01260     Two strategies come to mind:
01261     1: keep things as they are but limit the size of the buffers.
01262     2: have the position of 'pos' at about 1/3 of the buffer.
01263         this is of course guess work.
01264     Currently we have implemented the first method by creating the
01265     setup parameter threadscratchsize with the default value 100K.
01266     In the test program much bigger values gave a slower program.

4.150.1 Detailed Description

Routines that deal with the transform statement and its varieties.

Definition in file [transform.c](#).

4.150.2 Function Documentation

4.150.2.1 CoTransform()

```
int CoTransform (
    UBYTE * in )
```

Definition at line [87](#) of file [transform.c](#).

4.150.2.2 RunTransform()

```
int RunTransform (
    PHEAD WORD * term,
    WORD * params )
```

Definition at line [750](#) of file [transform.c](#).

4.150.2.3 RunEncode()

```
int RunEncode (
    PHEAD WORD * fun,
    WORD * args,
    WORD * info )
```

Definition at line [1006](#) of file [transform.c](#).

4.150.2.4 RunDecode()

```
int RunDecode (
    PHEAD WORD * fun,
    WORD * args,
    WORD * info )
```

Definition at line 1193 of file [transform.c](#).

4.150.2.5 RunReplace()

```
int RunReplace (
    PHEAD WORD * fun,
    WORD * args,
    WORD * info )
```

Definition at line 1363 of file [transform.c](#).

4.150.2.6 RunImplode()

```
int RunImplode (
    WORD * fun,
    WORD * args )
```

Definition at line 1841 of file [transform.c](#).

4.150.2.7 RunExplode()

```
int RunExplode (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line 2042 of file [transform.c](#).

4.150.2.8 RunPermute()

```
int RunPermute (
    PHEAD WORD * fun,
    WORD * args,
    WORD * info )
```

Definition at line 2156 of file [transform.c](#).

4.150.2.9 RunReverse()

```
int RunReverse (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line 2383 of file [transform.c](#).

4.150.2.10 RunDedup()

```
int RunDedup (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line [2470](#) of file [transform.c](#).

4.150.2.11 RunCycle()

```
int RunCycle (
    PHEAD WORD * fun,
    WORD * args,
    WORD * info )
```

Definition at line [2559](#) of file [transform.c](#).

4.150.2.12 RunAddArg()

```
int RunAddArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line [2711](#) of file [transform.c](#).

4.150.2.13 RunMulArg()

```
int RunMulArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line [2800](#) of file [transform.c](#).

4.150.2.14 RunIsLyndon()

```
int RunIsLyndon (
    PHEAD WORD * fun,
    WORD * args,
    int par )
```

Definition at line [2941](#) of file [transform.c](#).

4.150.2.15 RunToLyndon()

```
WORD RunToLyndon (
    PHEAD WORD * fun,
    WORD * args,
    int par )
```

Definition at line [3019](#) of file [transform.c](#).

4.150.2.16 RunDropArg()

```
int RunDropArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line [3131](#) of file [transform.c](#).

4.150.2.17 RunSelectArg()

```
int RunSelectArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line [3157](#) of file [transform.c](#).

4.150.2.18 RunZtoHArg()

```
int RunZtoHArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line [3185](#) of file [transform.c](#).

4.150.2.19 RunHtoZArg()

```
int RunHtoZArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line [3241](#) of file [transform.c](#).

4.150.2.20 TestArgNum()

```
int TestArgNum (
    int n,
    int totarg,
    WORD * args )
```

Definition at line [3307](#) of file [transform.c](#).

4.150.2.21 PutArgInScratch()

```
WORD PutArgInScratch (
    WORD * arg,
    UWORD * scrat )
```

Definition at line [3376](#) of file [transform.c](#).

4.150.2.22 ReadRange()

```
UBYTE * ReadRange (
    UBYTE * s,
    WORD * out,
    int par )
```

Definition at line 3412 of file [transform.c](#).

4.150.2.23 FindRange()

```
int FindRange (
    PHEAD WORD * args,
    WORD * arg1,
    WORD * arg2,
    WORD totarg )
```

Definition at line 3572 of file [transform.c](#).

00037 /*
00038 * # [ Includes :
00039 * # [ Transform :
00040 * # [ Intro :
00041
00042 Here are the routines for the transform statement. This is a
00043 group of transformations on function arguments or groups of
00044 function arguments. The purpose of this command is that it
00045 avoids repetitive pattern matching.
00046 Syntax:
00047 Transform, SetOfFunctions, OneOrMoreTransformations;
00048 Each transformation is given by
00049 Replace(argfirst, arglast) = (,,)
00050 Encode(argfirst, arglast) : base = #
```

```

00051         Decode(argfirst,arglast):base=#
00052         Implode(argfirst,arglast)
00053         Explode(argfirst,arglast)
00054         Permute(cycle)(cycle)(cycle)...(cycle)
00055         Reverse(argfirst,arglast)
00056         Dedup(argfirst,arglast)
00057         Cycle(argfirst,arglast)=+/-num
00058         IsLyndon(argfirst,arglast)=(yes,no)
00059         ToLyndon(argfirst,arglast)=(yes,no)
00060     In replace the extra information is
00061         a replace_() without the name of the replace_ function.
00062         This can be as in (0,1,1,0) or (xarg_,1-xarg_) to indicate
00063         a symbolic argument or (x,y,y,x) to exchange x and y, etc.
00064     In Encode and Decode argfirst is the most significant 'word' and
00065     arglast is the least significant 'word'.
00066     Note that we need to introduce the generic symbolic arguments xarg_,
00067     parg_, iarg_ and farg_.
00068     Examples:
00069         Transform,{H,E}
00070             ,Replace(1:'WEIGHT')=(0,1,1,0)
00071             ,Encode(1:'WEIGHT')=base(2);
00072         Transform,{H,E}
00073             ,Decode(1:'WEIGHT')=base(3)
00074             ,Replace(1:'WEIGHT')=(2,-1,1,0,0,1);
00075     Others that can be added:
00076         symmetrize?
00077
00078     6-may-2016: Changed MAXPOSITIVE2 into MAXPOSITIVE4. This makes room
00079     for the use of dollar variables as arguments.

4.156.1 Detailed Description

Contains a number of defines to make the coding easier. Especially the defines for the use of the lists are very nice. And of course the AC for A.Cc and AT for either A.T or B->T are indispensable to keep FORM and TFORM in one set of sources.

4.158.1 Detailed Description

An implementation of dynamic array.

Example:

```
size_t i;
Vector(int, vec);
VectorPushBack(vec, 1);
VectorPushBack(vec, 2);
VectorPushBack(vec, 3);
for ( i = 0; i < VectorSize(vec); i++ )
    printf("%d\n", VectorPtr(vec)[i]);
VectorFree(vec);
```

Definition in file [vector.h](#).

4.158.2 Macro Definition Documentation

4.158.2.1 VectorStruct

```
#define VectorStruct(
    T )
```

Value:

```
struct { \
    T *ptr; \
    size_t size; \
    size_t capacity; \
}
```

A struct for vector objects.

Parameters

<i>T</i>	the type of elements.
----------	-----------------------

Definition at line 65 of file [vector.h](#).

4.158.2.2 Vector

```
#define Vector(
    T,
    X ) VectorStruct(T) X = { NULL, 0, 0 }
```

Defines and initialises a vector *X* of the type *T*. The user must call [VectorFree\(X\)](#) after the use of *X*.

Parameters

<i>T</i>	the type of elements.
<i>X</i>	the name of vector object

Definition at line 84 of file [vector.h](#).

4.158.2.3 DeclareVector

```
#define DeclareVector(  
    T,  
    X )  VectorStruct (T) X
```

Declares a vector *X* of the type *T*. The user must call [VectorInit\(X\)](#) before the use of *X*.

Parameters

<i>T</i>	the type of elements.
<i>X</i>	the name of vector object

Definition at line 99 of file [vector.h](#).

4.158.2.4 VectorInit

```
#define VectorInit(  
    X )
```

Value:

```
do { \  
    (X).ptr = NULL; \  
    (X).size = 0; \  
    (X).capacity = 0; \  
} while (0)
```

Initialises a vector *X* of the type *T*. The user must call [VectorFree\(X\)](#) after the use of *X*.

Parameters

<i>X</i>	the vector object.
----------	--------------------

Definition at line 113 of file [vector.h](#).

4.158.2.5 VectorFree

```
#define VectorFree(  
    X )
```

Value:

```
do { \
    M_free((X).ptr, "VectorFree:" #X); \
    (X).ptr = NULL; \
    (X).size = 0; \
    (X).capacity = 0; \
} while (0)
```

Frees the buffer allocated by the vector X.

Parameters

X	the vector object.
---	--------------------

Definition at line 130 of file [vector.h](#).

4.158.2.6 VectorPtr

```
#define VectorPtr(  
    X )    ((X).ptr)
```

Returns the pointer to the buffer for the vector X. NULL when [VectorCapacity\(X\)](#) == 0.

Parameters

X	the vector object.
---	--------------------

Returns

the pointer to the allocated buffer for the vector.

Definition at line 150 of file [vector.h](#).

4.158.2.7 VectorFront

```
#define VectorFront(  
    X )    ((X).ptr[0])
```

Returns the first element of the vector X. Undefined when [VectorSize\(X\)](#) == 0.

Parameters

X	the vector object.
---	--------------------

Returns

the first element of the vector.

Definition at line 165 of file [vector.h](#).

4.158.2.8 VectorBack

```
#define VectorBack(  
    X )    ((X).ptr[(X).size - 1])
```

Returns the last element of the vector X. Undefined when [VectorSize\(X\)](#) == 0.

Parameters

X	the vector object.
---	--------------------

Returns

the last element of the vector.

Definition at line 180 of file [vector.h](#).

4.158.2.9 VectorSize

```
#define VectorSize(  
    X )    ((X).size)
```

Returns the size of the vector X.

Parameters

X	the vector object.
---	--------------------

Returns

the size of the vector.

Definition at line 194 of file [vector.h](#).

4.158.2.10 VectorCapacity

```
#define VectorCapacity(  
    X )    ((X).capacity)
```

Returns the capacity (the number of the already allocated elements) of the vector X.

Parameters

X	the vector object.
---	--------------------

Returns

the capacity of the vector.

Definition at line 208 of file [vector.h](#).

4.158.2.11 VectorEmpty

```
#define VectorEmpty(  
    X )    ((X).size == 0)
```

Returns true the size of the vector X is zero.

Parameters

<i>X</i>	the vector object.
----------	--------------------

Returns

true if the vector has no elements, false otherwise.

Definition at line 222 of file [vector.h](#).

4.158.2.12 VectorClear

```
#define VectorClear(  
    X )    do { (X).size = 0; } while (0)
```

Sets the size of the vector X to zero.

Parameters

<i>X</i>	the vector object.
----------	--------------------

Definition at line 235 of file [vector.h](#).

4.158.2.13 VectorReserve

```
#define VectorReserve(  
    X,  
    newcapacity )
```

Value:

```
do { \
    size_t v_tmp_newcapacity_ = (newcapacity); \
    if ( (X).capacity < v_tmp_newcapacity_ ) { \
        void *v_tmp_newptr_; \
        v_tmp_newcapacity_ = (v_tmp_newcapacity_ * 3) / 2; \
        if ( v_tmp_newcapacity_ < 4 ) v_tmp_newcapacity_ = 4; \
        v_tmp_newptr_ = Malloc1(sizeof((X).ptr[0]) * v_tmp_newcapacity_, "VectorReserve:" #X); \
        if ( (X).ptr != NULL ) { \
            memcpy(v_tmp_newptr_, (X).ptr, (X).size * sizeof((X).ptr[0])); \
            M_free((X).ptr, "VectorReserve:" #X); \
        } \
        (X).ptr = v_tmp_newptr_; \
        (X).capacity = v_tmp_newcapacity_; \
    } \
} while (0)
```

Requires that the capacity of the vector X is equal to or larger than newcapacity.

Parameters

<i>X</i>	the vector object.
<i>newcapacity</i>	the capacity to be reserved.

Definition at line 249 of file [vector.h](#).

4.158.2.14 VectorPushBack

```
#define VectorPushBack(  
    X,  
    x )
```

Value:

```
do { \  
    VectorReserve((X), (X).size + 1); \  
    (X).ptr[(X).size++] = (x); \  
} while (0)
```

Adds an element *x* at the end of the vector *X*.

Parameters

<i>X</i>	the vector object.
<i>x</i>	the element to be added.

Definition at line 277 of file [vector.h](#).

4.158.2.15 VectorPushBacks

```
#define VectorPushBacks(  
    X,  
    src,  
    n )
```

Value:

```
do { \  
    size_t v_tmp_n_ = (n); \  
    VectorReserve((X), (X).size + v_tmp_n_); \  
    memcpy((X).ptr + (X).size, (src), v_tmp_n_ * sizeof((X).ptr[0])); \  
    (X).size += v_tmp_n_; \  
} while (0)
```

Adds an *n* elements of *src* at the end of the vector *X*.

Parameters

<i>X</i>	the vector object.
<i>src</i>	the starting address of the buffer storing elements to be added.
<i>n</i>	the number of elements to be added.

Definition at line 295 of file [vector.h](#).

4.158.2.16 VectorPopBack

```
#define VectorPopBack(  
    X ) do { (X).size --; } while (0)
```

Removes the last element of the vector X. [VectorSize\(X\)](#) must be > 0 .

Parameters

<i>X</i>	the vector object.
----------	--------------------

Definition at line 314 of file [vector.h](#).

4.158.2.17 VectorInsert

```
#define VectorInsert(  
    X,  
    index,  
    x )
```

Value:

```
do { \
    size_t v_tmp_index_ = (index); \
    VectorReserve((X), (X).size + 1); \
    memmove((X).ptr + v_tmp_index_ + 1, (X).ptr + v_tmp_index_, ((X).size - v_tmp_index_) * \
        sizeof((X).ptr[0])); \
    (X).ptr[v_tmp_index_] = (x); \
    (X).size++; \
} while (0)
```

Inserts an element x at the specified index of the vector X. The index must be $0 \leq \text{index} < \text{VectorSize}(X)$.

Parameters

<i>X</i>	the vector object.
<i>index</i>	the position at which the element will be inserted.
<i>x</i>	the element to be inserted.

Definition at line 330 of file [vector.h](#).

4.158.2.18 VectorInserts

```
#define VectorInserts(  
    X,  
    index,  
    src,  
    n )
```

Value:

```
do { \
    size_t v_tmp_index_ = (index), v_tmp_n_ = (n); \
    VectorReserve((X), (X).size + v_tmp_n_); \
    memmove((X).ptr + v_tmp_index_ + v_tmp_n_, (X).ptr + v_tmp_index_, ((X).size - v_tmp_index_) * \
        sizeof((X).ptr[0])); \
    memcpy((X).ptr + v_tmp_index_, (src), v_tmp_n_ * sizeof((X).ptr[0])); \
    (X).size += v_tmp_n_; \
} while (0)
```

Inserts an n elements of src at the specified index of the vector X. The index must be $0 \leq \text{index} < \text{VectorSize}(X)$.

Parameters

<i>X</i>	the vector object.
<i>index</i>	the position at which the elements will be inserted.
<i>src</i>	the starting address of the buffer storing elements to be inserted.
<i>n</i>	the number of elements to be inserted.

Definition at line 353 of file [vector.h](#).

4.158.2.19 VectorErase

```
#define VectorErase(
    X,
    index )
```

Value:

```
do { \
    size_t v_tmp_index_ = (index); \
    memmove((X).ptr + v_tmp_index_, (X).ptr + v_tmp_index_ + 1, ((X).size - v_tmp_index_ - 1) * \
    sizeof((X).ptr[0])); \
    (X).size--; \
} while (0)
```

Removes an element at the specified index of the vector *X*. The index must be $0 \leq \text{index} < \text{VectorSize}(X)$.

Parameters

<i>X</i>	the vector object.
<i>index</i>	the position of the element to be removed.

Definition at line 374 of file [vector.h](#).

4.158.2.20 VectorErases

```
#define VectorErases(
    X,
    index,
    n )
```

Value:

```
do { \
    size_t v_tmp_index_ = (index), v_tmp_n_ = (n); \
    memmove((X).ptr + v_tmp_index_, (X).ptr + v_tmp_index_ + v_tmp_n_, ((X).size - v_tmp_index_ - 1) * \
    sizeof((X).ptr[0])); \
    (X).size -= v_tmp_n_; \
} while (0)
```

Removes an *n* elements at the specified index of the vector *X*. The index must be $0 \leq \text{index} < \text{VectorSize}(X) - n + 1$.

Parameters

<i>X</i>	the vector object.
<i>index</i>	the starting position of the elements to be removed.
<i>n</i>	the number of elements to be removed.

Definition at line 394 of file [vector.h](#).

4.160.1 Detailed Description

Contains the functions that deal with the wildcards. During the pattern matching there are two steps: 1: check that a wildcard substitution is correct (if there was already an assignment for this variable, it is the same; it is part of the proper set; it is the proper type of variables, etc.) 2: make the assignment In addition we have to be able to clear assignments. During execution we have to make the actual replacements (WildFill)

01769     #[ CheckWild :          WORD CheckWild(oldnumber,type,newnumber,newval)
01770
01771     Tests whether a wildcard assignment is allowed.
01772     A return value of zero means that it is allowed (nihil obstat).
01773     If the variable has been assigned already its existing
01774     assignment is returned in AN.oldvalue and AN.oldtype, which are
01775     global variables.
01776
01777     Note the special problem with name?set[i]. Here we have to pass
01778     an extra assignment. This cannot be done via globals as we
01779     call CheckWild sometimes twice before calling AddWild.
01780     Trick: Check the assignment of the number and if OK put it
01781     in place, but don't alter the used flag (if needed).
01782     Then AddWild can alter the used flag but the value is there.
01783     As long as this trick is 'hanging' we turn on the flag:
01784     'AN.WildReserve' which is either turned off by AddWild or by
01785     a failing call to CheckWild.
01786
01787     With ARGTOARG the tensors give the number of arguments
01788     or-ed with EATTENSOR which is at least 8192.
