4.29.1 Detailed Description

Evaluation of functions for the floating-point system, by interfacing with MPFR.

Definition in file [evaluate.c](#).

4.29.2 Macro Definition Documentation

4.29.2.1 EXTRAPRECISION

```
#define EXTRAPRECISION 4
```

Definition at line 40 of file [evaluate.c](#).

4.29.2.2 RND

```
#define RND MPFR_RNDN
```

Definition at line 42 of file [evaluate.c](#).

4.29.2.3 auxr1

```
#define auxr1 (((mpfr_t *) (AT.auxr_)) [0])
```

Definition at line 44 of file [evaluate.c](#).

4.29.2.4 auxr2

```
#define auxr2 (((mpfr_t *) (AT.auxr_)) [1])
```

Definition at line 45 of file [evaluate.c](#).

4.29.2.5 auxr3

```
#define auxr3 (((mpfr_t *) (AT.auxr_)) [2])
```

Definition at line 46 of file [evaluate.c](#).

4.29.2.6 auxr4

```
#define auxr4 (((mpfr_t *) (AT.auxr_)) [3])
```

Definition at line 47 of file [evaluate.c](#).

4.29.2.7 auxr5

```
#define auxr5 ((mpfr_t *) (AT.auxr_))[4])
```

Definition at line 48 of file [evaluate.c](#).

4.29.3 Function Documentation

4.29.3.1 PackFloat()

```
int PackFloat (
    WORD * fun,
    mpf_t infloat )
```

Definition at line 271 of file [float.c](#).

4.29.3.2 UnpackFloat()

```
int UnpackFloat (
    mpf_t outfloat,
    WORD * fun )
```

Definition at line 366 of file [float.c](#).

4.29.3.3 RatToFloat()

```
void RatToFloat (
    mpf_t result,
    UWORD * formrat,
    int ratsize )
```

Definition at line 622 of file [float.c](#).

4.29.3.4 FormtoZ()

```
void FormtoZ (
    mpz_t z,
    UWORD * a,
    WORD na )
```

Definition at line 513 of file [float.c](#).

4.29.3.5 IntegerToFloatr()

```
void IntegerToFloatr (
    mpfr_t result,
    UWORD * formlong,
    int longsize )
```

Definition at line 66 of file [evaluate.c](#).

4.29.3.6 RatToFloatr()

```
void RatToFloatr (
    mpfr_t result,
    UWORD * format,
    int ratsize )
```

Definition at line 82 of file [evaluate.c](#).

4.29.3.7 SetFloatPrecision()

```
void SetFloatPrecision (
    LONG prec )
```

Definition at line 109 of file [evaluate.c](#).

4.29.3.8 ClearFloat()

```
void ClearFloat (
    void )
```

Definition at line 142 of file [evaluate.c](#).

4.29.3.9 GetFloatArgument()

```
int GetFloatArgument (
    PHEAD mpfr_t f_out,
    WORD * fun,
    int par )
```

Definition at line 181 of file [evaluate.c](#).

4.29.3.10 GetPiArgument()

```
int GetPiArgument (
    PHEAD WORD * arg )
```

Definition at line 276 of file [evaluate.c](#).

4.29.3.11 EvaluateFun()

```
int EvaluateFun (
    PHEAD WORD * term,
    WORD level,
    WORD * pars )
```

Definition at line 369 of file [evaluate.c](#).

4.29.4 Variable Documentation

4.29.4.1 ln2

mpf_t ln2

Definition at line 50 of file [evaluate.c](#).

4.30 evaluate.c

00341 /*
00342     #] GetPiArgument :
00343     #[ EvaluateFun :
00344
00345     What we need to do is:
00346     1: look for a function to be treated.
00347     2: make sure its argument is treatable.
00348     3: call the proper mpfr_ function.
00349     4: accumulate the result.
00350     For some functions we have to insert 'smart' shortcuts as is
00351     the case with sin_(pi_) or sin_(pi_/6) of sqrt(4/9) etc.
00352     Otherwise we may have to insert a value for pi_ first.
00353     There are several types of arguments:
00354     a: (short) integers.
00355     b: rationals.
00356     c: floats.
00357     We accumulate the result(s) in auxr2. The argument comes in aux5
00358     and a result in auxr3 which then gets multiplied into auxr2.
00359     In the end we have to combine auxr2 with whatever coefficient
00360     existed already.
00361
00362     When the float system is started we need for aux only 3 variables
00363     per thread. auxr1-auxr3. This should be done separately.
00364     The main problem is the conversion of mpfr_t to float_ and/or mpf_t
00365     and back.

4.31.1 Detailed Description

The routines that start the execution phase of a module. It also contains the routines for placing the bracket subterm.

Definition in file [execute.c](#).

4.31.2 Macro Definition Documentation

4.31.2.1 CURRENTBRACKET

```
#define CURRENTBRACKET 1
```

Definition at line [2564](#) of file [execute.c](#).

4.31.2.2 BRACKETCURRENTEXPR

```
#define BRACKETCURRENTEXPR 2
```

```
int DoExecute (
    WORD par,
    WORD skip )
```

Definition at line 616 of file [execute.c](#).

4.31.3.7 PutBracket()

```
int PutBracket (
    PHEAD WORD * termin )
```

Definition at line 1112 of file [execute.c](#).

4.31.3.8 SpecialCleanup()

```
void SpecialCleanup (
    PHEAD0 )
```

Definition at line 1624 of file [execute.c](#).

4.31.3.9 SetMods()

```
void SetMods (
    void )
```

Definition at line 1638 of file [execute.c](#).

4.31.3.10 UnSetMods()

```
void UnSetMods (
    void )
```

Definition at line 1656 of file [execute.c](#).

4.31.3.11 ExchangeExpressions()

```
void ExchangeExpressions (
    int num1,
    int num2 )
```

Definition at line [1671](#) of file [execute.c](#).

4.31.3.12 GetFirstBracket()

```
int GetFirstBracket (
    WORD * term,
    int num )
```

Definition at line [1745](#) of file [execute.c](#).

4.31.3.13 GetFirstTerm()

```
int GetFirstTerm (
    WORD * term,
    int num,
    int pre )
```

Gets the first term of an expression. Routine should be thread safe.

Parameters

out	<i>term</i>	Pointer to the buffer where the term should be written.
in	<i>num</i>	The expression number from which to get the term.
in	<i>pre</i>	Denotes a pre-processor call (1) or not (0). Used to determine the correct source file for the expression.

Returns

First WORD of term, a negative value denotes an error.

00031 /*
00032 #[] Documentation :
00033
00034 This module is written by M.Tentyukov as a part of implementation of
00035 interaction between FORM and external processes, first release
00036 09.04.2004. A part of this code is copied from the DIANA project, which was
00037 written by M. Tentyukov and published under the GPL version 2 as
00038 published by the Free Software Foundation.
00039
00040 This file is completely re-written by M.Tentyukov in May 2006.
00041 Since the interface was changed, the public function were changed,
00042 also. A new public functions were added: initPresetExternalChannels()
00043 (see comments just before this function in the present file) and
00044 setKillModeForExternalChannel (a pointer, not a function).
00045
00046 If a macro WITHEXTERNALCHANNEL is not defined, all public functions
00047 are stubs returning failure.
00048
00049 The idea is to start an external command swallowing
00050 its stdin and stdout. This can be done by means of the function
00051 int openExternalChannel(cmd,daemonize,shellname,stderrname), where
00052 cmd is a command to run,
00053 daemonize: if !=0 then start the command in the "daemon" mode,
00054 shellname: if !=NULL, execute the command in a subshell,
00055 stderrname: if != NULL, redirect stderr of the command to this file.
00056 The function returns some small positive integer number (the
00057 descriptor of a newly created external channel), or -1 on failure.
00058
```

```

00059     After the command is started, it becomes a _current_ opened external
00060     channel. The buffer can be sent to its stdin by a function
00061     int writeBufToExtChannel(buf, n)
00062     (here buf is a pointer to the buffer, n is the length in bytes; the
00063     function returns 0 in success, or -1 on failure),
00064     or one character can be read from its stdout by
00065     means of the function
00066     int getcFromExtChannel().
00067
00068     The latter returns the
00069     character casted to integer, or something <0. This can be -2 (if there
00070     is no current external channel) or EOF, if the external program closes
00071     its stdout, or if the external program outputs a string coinciding
00072     with a _terminator_.
00073
00074     By default, the terminator is an empty line. For the current external
00075     channel it can be set by means of the function
00076     int setTerminatorForExternalChannel(newterminator).
00077     The function returns 0 in success, or !0 if something is wrong (no
00078     current channel, too long terminator).
00079
00080     After getcFromExtChannel() returns EOF, the current channel becomes
00081     undefined. Any further attempts to read information by
00082     getcFromExtChannel() result in -2. To set (re-set) a current channel,
00083     the function
00084     int selectExternalChannel(n)
00085     can be used. This function accepts the valid external channel
00086     descriptor (returned by openExternalChannel) and returns the
00087     descriptor of a previous current channel (0, if there was no current
00088     channel, or -1, if the external channel descriptor is invalid).
00089     If n == 0, the function undefine the current external channel.
00090
00091     The function
00092     int closeExternalChannel(n)
00093     destroys the opened external channel with the descriptor n. It returns
00094     0 in success, or -1 on failure. If the corresponding external channel
00095     was the current one, the current channel becomes undefined. If n==0,
00096     the function closes the current external channel.
00097
00098     The function
00099     int getCurrentExternalChannel(void)
00100     returns the descriptor if the current external channel, or 0 , if
00101     there is no current external channel.
00102
00103     The function
00104     void closeAllExternalChannels(void)
00105
00106     destroys all opened external channels.
00107
00108     List of all public functions:
00109     int openExternalChannel(UBYTE *cmd,int daemonize,UBYTE *shellname, UBYTE * stderrname);
00110     int initPresetExternalChannels(UBYTE *theline, int thetimeout);
00111     int setTerminatorForExternalChannel(char *newterminator);
00112     int setKillModeForExternalChannel(int signum, int sentToWholeGroup);
00113     int closeExternalChannel(int n);
00114     int selectExternalChannel(int n);
00115     int writeBufToExtChannel(char *buf,int n);
00116     int getcFromExtChannel(void);
00117     int getCurrentExternalChannel(void);
00118     void closeAllExternalChannels(void);
00119
00120     ATTENTION!
00121
00122     Four of them:
00123     1 setTerminatorForExternalChannel
00124     2 setKillModeForExternalChannel
00125     3 writeBufToExtChannel
00126     4 getcFromExtChannel
00127
00128     are NOT functions, but variables (pointers) of a corresponding type.
00129     They are initialised by proper values to avoid repeated error checking.
00130
00131     All public functions are independent of realization hidden in this module.
00132     All other functions may have a returned type/parameters type local w.r.t.
00133     this module; they are not declared outside of this file.

4.37.1 Detailed Description

Pattern matching of symbols and dotproducts. There are various routines because of the options in the id-statements like once, only, multi and many. These are among the oldest routines in FORM and that can be noticed, because the interplay with the function matching is not complete. When we match functions and halfway we fail we can backtrack properly. With the symbols, the dotproducts and the vectors (in [pattern.c](#)) there is no proper backtracking. Hence the routines here need still quite some work or may even have to be rewritten.

00048
00049     The current version doesn't scan function arguments yet. 10-Apr-1988
00050
00051     This routine searches for an exact match. This means in particular:
00052     1: x^# must match exactly.
00053     2: x^n? must have a single value for n that cannot be adapted.
00054
00055     When setp != 0 it points to a collection of sets
00056     A match can occur only if no object will be left that belongs
00057     to any of these sets.
00058 */

Include dependency graph for flintinterface.cc:

Macros

- `#define UNIVARIATE_DENSITY_THR 0.02f`
- `#define IFW(x) { if ( write ) {x;} }`

4.39.1 Detailed Description

Contains functions which interface with FLINT functions to perform arithmetic with uni- and multi-variate polynomials and perform factorization.

Definition in file [flintinterface.cc](#).

4.39.2 Macro Definition Documentation

4.39.2.1 UNIVARIATE_DENSITY_THR

```
#define UNIVARIATE_DENSITY_THR 0.02f
```

Definition at line 71 of file [flintinterface.cc](#).

4.39.2.2 IFW

```
#define IFW(
    x ) { if ( write ) {x;} }
```

Definition at line 1779 of file [flintinterface.cc](#).

4.41.1 Detailed Description

Prototypes for functions in [flintinterface.cc](#)

Definition in file [flintinterface.h](#).

4.41.2 Typedef Documentation

4.41.2.1 var_map_t

```
typedef std::map<uint32_t,uint32_t> flint::var_map_t
```

Definition at line 76 of file [flintinterface.h](#).

4.41.3 Function Documentation

4.41.3.1 cleanup()

```
void flint::cleanup (
    void )
```

Definition at line 76 of file [flintinterface.cc](#).

4.41.3.2 cleanup_master()

```
void flint::cleanup_master (
    void )
```

Definition at line 83 of file [flintinterface.cc](#).

4.41.3.3 divmod_mpoly()

```
WORD * flint::divmod_mpoly (
    PHEAD const WORD * a,
    const WORD * b,
    const bool return_rem,
    const WORD must_fit_term,
    const var_map_t & var_map )
```

Definition at line 91 of file [flintinterface.cc](#).

4.41.3.4 divmod_poly()

```
WORD * flint::divmod_poly (
    PHEAD const WORD * a,
    const WORD * b,
    const bool return_rem,
    const WORD must_fit_term,
    const var_map_t & var_map )
```

Definition at line 161 of file [flintinterface.cc](#).

4.41.3.5 factorize_mpoly()

```
WORD * flint::factorize_mpoly (
    PHEAD const WORD * argin,
    WORD * argout,
    const bool with_arghead,
    const bool is_fun_arg,
    const var_map_t & var_map )
```

Definition at line 235 of file [flintinterface.cc](#).

4.41.3.6 factorize_poly()

```
WORD * flint::factorize_poly (
    PHEAD const WORD * argin,
    WORD * argout,
    const bool with_arghead,
    const bool is_fun_arg,
    const var_map_t & var_map )
```

Definition at line 383 of file [flintinterface.cc](#).

4.41.3.7 form_sort()

```
void flint::form_sort (
    PHEAD WORD * terms )
```

Definition at line 456 of file [flintinterface.cc](#).

4.41.3.8 from_argument_mpoly()

```
uint64_t flint::from_argument_mpoly (
    fmpz_mpoly_t poly,
    fmpz_mpoly_t denpoly,
    const WORD * args,
    const bool with_arghead,
    const var_map_t & var_map,
    const fmpz_mpoly_ctx_t ctx )
```

Definition at line 511 of file [flintinterface.cc](#).

4.41.3.9 from_argument_poly()

```
uint64_t flint::from_argument_poly (
    fmpz_poly_t poly,
    fmpz_poly_t denpoly,
    const WORD * args,
    const bool with_arghead )
```

Definition at line 654 of file [flintinterface.cc](#).

4.41.3.10 fmpz_get_form()

```
WORD flint::fmpz_get_form (
    fmpz_t z,
    WORD * a )
```

Definition at line 784 of file [flintinterface.cc](#).

4.41.3.11 fmpz_set_form()

```
void flint::fmpz_set_form (
    fmpz_t z,
    UWORD * a,
    WORD na )
```

Definition at line 849 of file [flintinterface.cc](#).

4.41.3.12 gcd_mpoly()

```
WORD * flint::gcd_mpoly (
    PHEAD const WORD * a,
    const WORD * b,
    const WORD must_fit_term,
    const var_map_t & var_map )
```

Definition at line 915 of file [flintinterface.cc](#).

4.41.3.13 gcd_poly()

```
WORD * flint::gcd_poly (
    PHEAD const WORD * a,
    const WORD * b,
    const WORD must_fit_term,
    const var_map_t & var_map )
```

Definition at line 1011 of file [flintinterface.cc](#).

4.41.3.14 get_variables()

```
flint::var_map_t flint::get_variables (
    const vector< WORD * > & es,
    const bool with_arghead,
    const bool sort_vars )
```

Definition at line 1093 of file [flintinterface.cc](#).

4.41.3.15 inverse_poly()

```
WORD * flint::inverse_poly (
    PHEAD const WORD * a,
    const WORD * b,
    const var_map_t & var_map )
```

Definition at line 1210 of file [flintinterface.cc](#).

4.41.3.16 mul_mpoly()

```
WORD * flint::mul_mpoly (
    PHEAD const WORD * a,
    const WORD * b,
    const var_map_t & var_map )
```

Definition at line 1286 of file [flintinterface.cc](#).

4.41.3.17 mul_poly()

```
WORD * flint::mul_poly (
    PHEAD const WORD * a,
    const WORD * b,
    const var_map_t & var_map )
```

Definition at line 1338 of file [flintinterface.cc](#).

4.41.3.18 ratfun_add_mpoly()

```
void flint::ratfun_add_mpoly (
    PHEAD const WORD * t1,
    const WORD * t2,
    WORD * out,
    const var_map_t & var_map )
```

Definition at line 1389 of file [flintinterface.cc](#).

4.41.3.19 ratfun_add_poly()

```
void flint::ratfun_add_poly (
    PHEAD const WORD * t1,
    const WORD * t2,
    WORD * out,
    const var_map_t & var_map )
```

Definition at line 1441 of file [flintinterface.cc](#).

4.41.3.20 ratfun_normalize_mpoly()

```
void flint::ratfun_normalize_mpoly (
    PHEAD WORD * term,
    const var_map_t & var_map )
```

Definition at line 1494 of file [flintinterface.cc](#).

4.41.3.21 `ratfun_normalize_poly()`

```
void flint::ratfun_normalize_poly (
    PHEAD WORD * term,
    const var_map_t & var_map )
```

Definition at line 1577 of file [flintinterface.cc](#).

4.41.3.22 `ratfun_read_mpoly()`

```
void flint::ratfun_read_mpoly (
    const WORD * a,
    fmpz_mpoly_t num,
    fmpz_mpoly_t den,
    const var_map_t & var_map,
    fmpz_mpoly_ctx_t ctx )
```

Definition at line 1660 of file [flintinterface.cc](#).

4.41.3.23 `ratfun_read_poly()`

```
void flint::ratfun_read_poly (
    const WORD * a,
    fmpz_poly_t num,
    fmpz_poly_t den )
```

Definition at line 1718 of file [flintinterface.cc](#).

4.41.3.24 `to_argument_mpoly()` [1/2]

```
uint64_t flint::to_argument_mpoly (
    PHEAD WORD * out,
    const bool with_arghead,
    const bool must_fit_term,
    const bool write,
    const uint64_t prev_size,
    const fmpz_mpoly_t poly,
    const var_map_t & var_map,
    const fmpz_mpoly_ctx_t ctx )
```

Definition at line 1976 of file [flintinterface.cc](#).

4.41.3.25 `to_argument_mpoly()` [2/2]

```
uint64_t flint::to_argument_mpoly (
    PHEAD WORD * out,
    const bool with_arghead,
    const bool must_fit_term,
    const bool write,
    const uint64_t prev_size,
    const fmpz_mpoly_t poly,
    const var_map_t & var_map,
    const fmpz_mpoly_ctx_t ctx,
    const fmpz_t denscale )
```

Definition at line 1780 of file [flintinterface.cc](#).

4.41.3.26 to_argument_poly() [1/2]

```
uint64_t flint::to_argument_poly (
    PHEAD WORD * out,
    const bool with_arghead,
    const bool must_fit_term,
    const bool write,
    const uint64_t prev_size,
    const fmpz_poly_t poly,
    const var_map_t & var_map )
```

Definition at line [2167](#) of file [flintinterface.cc](#).

4.41.3.27 to_argument_poly() [2/2]

```
uint64_t flint::to_argument_poly (
    PHEAD WORD * out,
    const bool with_arghead,
    const bool must_fit_term,
    const bool write,
    const uint64_t prev_size,
    const fmpz_poly_t poly,
    const var_map_t & var_map,
    const fmpz_t denscale )
```

Definition at line [1998](#) of file [flintinterface.cc](#).

4.41.3.28 simplify_fmpz()

```
void flint::util::simplify_fmpz (
    fmpz_t num,
    fmpz_t den,
    fmpz_t gcd ) [inline]
```

Definition at line [2188](#) of file [flintinterface.cc](#).

4.41.3.29 simplify_fmpz_poly()

```
void flint::util::simplify_fmpz_poly (
    fmpz_poly_t num,
    fmpz_poly_t den,
    fmpz_poly_t gcd ) [inline]
```

Definition at line [2200](#) of file [flintinterface.cc](#).

4.41.3.30 fix_sign_fmpz_mpoly_ratfun()

```
void flint::util::fix_sign_fmpz_mpoly_ratfun (
    fmpz_mpoly_t num,
    fmpz_mpoly_t den,
    const fmpz_mpoly_ctx_t ctx ) [inline]
```

Definition at line [2217](#) of file [flintinterface.cc](#).

4.41.3.31 fix_sign_fmpz_poly_ratfun()

```
void flint::util::fix_sign_fmpz_poly_ratfun (
    fmpz_poly_t num,
    fmpz_poly_t den ) [inline]
```

Definition at line 2229 of file [flintinterface.cc](#).

4.43.1 Detailed Description

Contains functions to call FLINT interface from the rest of FORM.

Definition in file [flintwrap.cc](#).

4.43.2 Function Documentation

4.43.2.1 flint_final_cleanup_thread()

```
void flint_final_cleanup_thread (
    void )
```

Definition at line 43 of file [flintwrap.cc](#).

4.43.2.2 flint_final_cleanup_master()

```
void flint_final_cleanup_master (
    void )
```

Definition at line 50 of file [flintwrap.cc](#).

4.43.2.3 flint_div()

```
WORD * flint_div (
    PHEAD WORD * a,
    WORD * b,
    const WORD must_fit_term )
```

Definition at line 57 of file [flintwrap.cc](#).

4.43.2.4 flint_factorize_argument()

```
int flint_factorize_argument (
    PHEAD WORD * argin,
    WORD * argout )
```

Definition at line 79 of file [flintwrap.cc](#).

4.43.2.5 flint_factorize_dollar()

```
WORD * flint_factorize_dollar (
    PHEAD WORD * argin )
```

Definition at line 100 of file [flintwrap.cc](#).

4.43.2.6 flint_gcd()

```
WORD * flint_gcd (
    PHEAD WORD * a,
    WORD * b,
    const WORD must_fit_term )
```

Definition at line 119 of file [flintwrap.cc](#).

4.43.2.7 flint_inverse()

```
WORD * flint_inverse (
    PHEAD WORD * a,
    WORD * b )
```

Definition at line 140 of file [flintwrap.cc](#).

4.43.2.8 flint_mul()

```
WORD * flint_mul (
    PHEAD WORD * a,
    WORD * b )
```

Definition at line 161 of file [flintwrap.cc](#).

4.43.2.9 flint_ratfun_add()

```
WORD * flint_ratfun_add (
    PHEAD WORD * t1,
    WORD * t2 )
```

Definition at line 180 of file [flintwrap.cc](#).

4.43.2.10 flint_ratfun_normalize()

```
int flint_ratfun_normalize (
    PHEAD WORD * term )
```

Definition at line 219 of file [flintwrap.cc](#).

4.43.2.11 flint_rem()

```
WORD * flint_rem (
    PHEAD WORD * a,
    WORD * b,
    const WORD must_fit_term )
```

Definition at line 292 of file [flintwrap.cc](#).

4.43.2.12 flint_check_version()

```
void flint_check_version (
    void )
```

Checks the FLINT library version at runtime.

This function should be called at startup. The program will terminate if a known buggy version of FLINT is detected.

Definition at line 321 of file [flintwrap.cc](#).

4.44 flintwrap.cc

4.45.1 Detailed Description

This file contains numerical routines that deal with floating point numbers. We use the GMP for arbitrary precision floating point arithmetic. The functions of the type sin, cos, ln, sqrt etc are handled by the mpfr library. The reason that for MZV's and the general notation we use the GMP (mpf_) is because the contents of the structs have been frozen and can be used for storage in a Form function float_. With mpfr_ this is not safely possible. All mpfr_ related code is in the file [evaluate.c](#).

Definition in file [float.c](#).

4.45.2 Macro Definition Documentation

4.45.2.1 WITHCUTOFF

```
#define WITHCUTOFF
```

Definition at line 45 of file [float.c](#).

4.45.2.2 GMPSPREAD

```
#define GMPSPREAD (GMP_LIMB_BITS/BITSINWORD)
```

Definition at line 47 of file [float.c](#).

4.45.3 Function Documentation

4.45.3.1 Form_mpf_init()

```
void Form_mpf_init (  
    mpf_t t )
```

Definition at line 177 of file [float.c](#).

4.45.3.2 Form_mpf_clear()

```
void Form_mpf_clear (  
    mpf_t t )
```

Definition at line 201 of file [float.c](#).

4.45.3.3 Form_mpf_set_prec_raw()

```
void Form_mpf_set_prec_raw (  
    mpf_t t,  
    ULONG newprec )
```

Definition at line 227 of file [float.c](#).

4.45.3.4 FormtoZ()

```
void FormtoZ (  
    mpz_t z,  
    UWORD * a,  
    WORD na )
```

Definition at line 513 of file [float.c](#).

4.45.3.5 ZtoForm()

```
void ZtoForm (  
    UWORD * a,  
    WORD * na,  
    mpz_t z )
```

Definition at line 557 of file [float.c](#).

4.45.3.6 FloatToInteger()

```
long FloatToInteger (
    UWORD * out,
    mpf_t floatin,
    long * bitsused )
```

Definition at line 583 of file [float.c](#).

4.45.3.7 IntegerToFloat()

```
void IntegerToFloat (
    mpf_t result,
    UWORD * formlong,
    int longsize )
```

Definition at line 606 of file [float.c](#).

4.45.3.8 FloatToRat()

00079
00080 /*
00081 *   #[] Includes :
00082 *   #[] Some GMP float info :
00083 *
00084 *   From gmp.h:
00085 *
00086 *   typedef struct
00087 *   {
00088 *       int _mp_prec;           Max precision, in number of `mp_limb_t's.
00089 *                               Set by mpf_init and modified by
00090 *                               mpf_set_prec. The area pointed to by the
00091 *                               _mp_d field contains `prec' + 1 limbs.

```

```

00092     int _mp_size;      abs(_mp_size) is the number of limbs the
00093                        last field points to. If _mp_size is
00094                        negative this is a negative number.
00095     mp_exp_t _mp_exp; Exponent, in the base of 'mp_limb_t'.
00096     mp_limb_t *_mp_d; Pointer to the limbs.
00097 } __mpf_struct;
00098
00099 typedef __mpf_struct mpf_t[1];
00100
00101 Currently:
00102     sizeof(int) = 4
00103     sizeof(mpf_t) = 24
00104     sizeof(mp_limb_t) = 8,
00105     sizeof(mp_exp_t) = 8,
00106     sizeof a pointer is 8.
00107 If any of this changes in the future we would have to change the
00108 PackFloat and UnpackFloat routines.
00109
00110 Our float_ function is packed with the 4 arguments:
00111     -SNUMBER _mp_prec
00112     -SNUMBER _mp_size
00113     exponent which can be -SNUMBER or a regular term
00114     the limbs as n/1 in regular term format, or just an -SNUMBER.
00115 During normalization the sign is taken away from the second argument
00116 and put as the sign of the complete term. This is easier for the
00117 WriteInnerTerm routine in sch.c
00118
00119 Wildcarding of functions excludes matches with float_
00120 Float_ always ends up inside the bracket, just like poly(rat)fun.
00121
00122 From mpfr.h
00123
00124 The formats here are different. This has, among others, to do with
00125 the rounding. The result is that we need different aux variables
00126 when working with mpfr and we need a different conversion routine
00127 to float. It also means that we need to treat the mvz_ etc functions
00128 completely separately. For now we try to develop that in the file
00129 Evaluate.c. At a later stage we may merge the two files.
00130 Originally we had the sqrt in float.c but it seems better to put
00131 it in Evaluate.c
00132
00133 #] Some GMP float info :
00134 #[ Low Level :
00135
00136     In the low level routines we interact directly with the content
00137     of the GMP structs. This can be done safely, because their
00138     layout is documented. We pay particular attention to the init
00139     and clear routines, because they involve malloc/free calls.
00140
00141     #[ Explanations :
00142
00143 We need a number of facilities inside Form to deal with floating point
00144 numbers, taking into account that they are only meant for sporadic use.
00145 1: We need a special function float_ who's arguments contain a limb
00146    representation of the mpf_t of the gmp.
00147 2: Some functions may return a floating point number. This is then in
00148    the form of an occurrence of the function float_.
00149 3: We need a print routine to print this float_.
00150 4: We need routines for conversions:
00151    a: (long) int to float.
00152    b: rat to float.
00153    c: float to rat (if possible)
00154    d: float to integer (with rounding toward zero).
00155 5: We need calculational operations for add, sub, mul, div, exp.
00156 6: We need service routines to pack and unpack the function float_.
00157 7: The coefficient should be pulled inside float_.
00158 8: Float_ cannot occur inside PolyRatFun.
00159 9: We need to be able to treat float_ as the coefficient during sorting.
00160 10: For now, we need the functions mvzf_ and eulerf_ for the evaluation
00161     of mvz's and euler sums.
00162 11: We need a setting for the default precision.
00163 12: We need a special flag for the dirty field of arguments to avoid
00164     the normalization of the argument with the limbs.
00165     Alternatively, the float_ should be not a regular function, but
00166     get a status < FUNCTION. Just like SNUMBER, LNUMBER etc.
00167
00168 Note that we can keep this thread-safe. The only routine that is not
00169 thread-safe is the print routine, but that is in accordance with all
00170 other print routines in Form. When called from MesPrint it needs to
00171 be protected by a lock, as is done standard inside Form.
00172
00173 #] Explanations :
00174 #[ Form_mpf_init :

00251 /*
00252     #] Form_mpf_set_prec_raw :
00253     #[ PackFloat :
00254
00255     Puts an object of type mpf_t inside a function float_
00256     float_(prec, nlimbs, exp, limbs);
00257     Complication: the limbs and the exponent are long's. That means
00258     two times the size of a Form (U)WORD.
00259     To save space we could split the limbs in two because Form stores
00260     coefficients as rationals with equal space for numerator and denominator.
00261     Hence for each limb we could put the most significant UWORD in the
00262     numerator and the least significant limb in the denominator.
00263     This gives a problem with the compilation and subsequent potential
00264     normalization of the 'fraction'. Hence for now we take the wasteful
00265     approach. At a later stage we can try to veto normalization of FLOATFUN.

```

```

00266     Caution: gmp/fmp is little endian and Form is big endian.
00267
00268     Zero is represented by zero limbs (and zero exponent).

01600 /*
01601     #] Chop :
01602     #] Float Routines :
01603     #[ Sorting :
01604
01605     We need a method to see whether two terms need addition that could
01606     involve floating point numbers.
01607     1: if PolyWise is active, we do not need anything, because
01608         Poly(Rat)Fun and floating point are mutually exclusive.
01609     2: This means that there should be only interference in AddCoef.
01610         and the AddRat parts in MergePatches, MasterMerge, SortBotMerge
01611         and PF_GetLoser.
01612     The compare routine(s) should recognise the float_ and give off
01613     a code (SortFloatMode) inside the AT struct:
01614     0: no float_
01615     1: float_ in term1 only
01616     2: float_ in term2 only
01617     3: float_ in both terms
01618     Be careful: we have several compare routines, because various codes
01619     use their own routines and we just set a variable with its address.
01620     Currently we have Compare1, CompareSymbols and CompareHSymbols.
01621     Only Compare1 should be active for this. The others should make sure
01622     that the proper variable is always zero.
01623     Remember: the sign of the coefficient is in the last word of the term.
01624
01625     We need two routines:
01626     1: AddWithFloat for SplitMerge which sorts by pointer.
01627     2: MergeWithFloat for MergePatches etc which keeps terms as much
01628         as possible in their location.
01629     The routines start out the same, because AT.SortFloatMode, set in
01630     Compare1, tells more or less what should be done.
01631     The difference is in where we leave the result.
01632
01633     In the future we may want to add a feature that makes the result
01634     zero if the sum comes within a certain distance of the numerical
01635     accuracy, like for instance 5% of the number of bits.
01636

02395 /*
02396     #] CalculateMZV :
02397     #[ CalculateEuler :
02398
02399     There is a problem of notation here.
02400     Basically there are two notations.
02401     1:  $Z(m1,m2,m3) = \sum_{j3,1,inf,sign\_}(m3) / j3^{abs\_}(m3) * \sum_{j2,j3+1,inf,sign\_}(m2) / j2^{abs\_}(m2) * \sum_{j1,j2+1,inf,sign\_}(m1) / j1^{abs\_}(m1) ) )$ 
02402
02403     See Broadhurst,1996
02404     2:  $L(m1,m2,m3) = \sum_{j1,1,inf,sign\_}(m1) * \sum_{j2,1,inf,sign\_}(m2) * \sum_{j3,1,inf,sign\_}(m3) / j3^{abs\_}(m3) / (j2+j3)^{abs\_}(m2) / (j1+j2+j3)^{abs\_}(m1) ) )$ 
02405
02406     See Borwein, Bradley, Broadhurst and Lisonek, 1999
02407     The L corresponds with the H of the datamine up to sign_(m1*m2*m3)
02408     The algorithm follows 2, but the more common notation is 1.
02409     Hence we start with a conversion.

02512 /*
02513     #] ExpandEuler :
02514     #[ EvaluateEuler :
02515
02516     There are various steps here:
02517     1: locate an Euler function.
02518     2: evaluate it into a float.
02519     3: convert the coefficient to a float and multiply.
02520     4: Put the new term together.
02521     5: Restart to see whether there are more Euler functions.
02522     The compiler should check that there is no conflict between
02523     the evaluate command and a potential polyfun or polyratfun.
02524     Yet, when reading in expressions there can be a conflict.
02525     Hence the Normalize routine should check as well.

Functions

- **STATIC_ASSERT** (sizeof(WORD) *8==BITSINWORD)
- **STATIC_ASSERT** (sizeof(LONG) *8==BITSINLONG)
- **STATIC_ASSERT** (sizeof(LONG) >=sizeof(int *))
- **STATIC_ASSERT** (sizeof(int *) >=sizeof(int))
- **STATIC_ASSERT** (sizeof(int) >=sizeof(WORD))
- **STATIC_ASSERT** (sizeof(WORD) >=sizeof(char))
- **STATIC_ASSERT** (sizeof(char)==1)
- **STATIC_ASSERT** (sizeof(off_t) >=sizeof(LONG))

4.47.1 Detailed Description

Contains critical defines for the compilation process Also contains the inclusion of all necessary header files. There are also some system dependencies concerning file functions.

4.47.2 Macro Definition Documentation

4.47.2.1 MAJORVERSION

```
#define MAJORVERSION 5
```

Definition at line [47](#) of file [form3.h](#).

4.47.2.2 MINORVERSION

```
#define MINORVERSION 0
```

Definition at line [48](#) of file [form3.h](#).

4.47.2.3 PRODUCTIONDATE

```
#define PRODUCTIONDATE "8-nov-2022"
```

Definition at line [53](#) of file [form3.h](#).

4.47.2.4 BETAVERSION

```
#define BETAVERSION
```

Definition at line 57 of file [form3.h](#).

4.47.2.5 inline

```
#define inline
```

Definition at line 120 of file [form3.h](#).

4.47.2.6 NDEBUG

```
#define NDEBUG
```

Definition at line 147 of file [form3.h](#).

4.47.2.7 STATIC_ASSERT

```
#define STATIC_ASSERT(  
    condition ) STATIC_ASSERT__1(condition, __LINE__)
```

Definition at line 158 of file [form3.h](#).

4.47.2.8 STATIC_ASSERT__1

```
#define STATIC_ASSERT__1(  
    X,  
    L ) STATIC_ASSERT__2(X, L)
```

Definition at line 159 of file [form3.h](#).

4.47.2.9 STATIC_ASSERT__2

```
#define STATIC_ASSERT__2(  
    X,  
    L ) STATIC_ASSERT__3(X, L)
```

Definition at line 160 of file [form3.h](#).

4.47.2.10 STATIC_ASSERT__3

```
#define STATIC_ASSERT__3(  
    X,  
    L ) typedef char static_assertion_failed_##L[ (!!(X))*2-1]
```

Definition at line 161 of file [form3.h](#).

4.47.2.11 BITSINWORD

```
#define BITSINWORD 32
```

Definition at line 200 of file [form3.h](#).

4.47.2.12 BITSINLONG

```
#define BITSINLONG 64
```

Definition at line 201 of file [form3.h](#).

4.47.2.13 WORD_MIN_VALUE

```
#define WORD_MIN_VALUE INT32_MIN
```

Definition at line 202 of file [form3.h](#).

4.47.2.14 WORD_MAX_VALUE

```
#define WORD_MAX_VALUE INT32_MAX
```

Definition at line 203 of file [form3.h](#).

4.47.2.15 LONG_MIN_VALUE

```
#define LONG_MIN_VALUE INT64_MIN
```

Definition at line 204 of file [form3.h](#).

4.47.2.16 LONG_MAX_VALUE

```
#define LONG_MAX_VALUE INT64_MAX
```

Definition at line 205 of file [form3.h](#).

4.47.2.17 TOPBITONLY

```
#define TOPBITONLY ((ULONG)1 << (BITSINWORD - 1)) /* 0x00008000UL */
```

Definition at line 242 of file [form3.h](#).

4.47.2.18 TOPLONGBITONLY

```
#define TOPLONGBITONLY ((ULONG)1 << (BITSINLONG - 1)) /* 0x80000000UL */
```

Definition at line 243 of file [form3.h](#).

4.47.2.19 SPECMASK

```
#define SPECMASK ((UWORD)1 << (BITSINWORD - 1)) /* 0x8000U */
```

Definition at line 244 of file [form3.h](#).

4.47.2.20 WILDMASK

```
#define WILDMASK ((UWORD)1 << (BITSINWORD - 2)) /* 0x4000U */
```

Definition at line 245 of file [form3.h](#).

4.47.2.21 WORDMASK

```
#define WORDMASK ((ULONG)FULLMAX - 1) /* 0x0000FFFFUL */
```

Definition at line 246 of file [form3.h](#).

4.47.2.22 AWORDMASK

```
#define AWORDMASK (WORDMASK << BITSINWORD) /* 0xFFFF0000UL */
```

Definition at line 247 of file [form3.h](#).

4.47.2.23 FULLMAX

```
#define FULLMAX ((LONG)1 << BITSINWORD) /* 0x00010000L */
```

Definition at line 248 of file [form3.h](#).

4.47.2.24 MAXPOSITIVE

```
#define MAXPOSITIVE ((LONG)(TOPBITONLY - 1)) /* 0x00007FFFL */
```

Definition at line 249 of file [form3.h](#).

4.47.2.25 MAXLONG

```
#define MAXLONG ((LONG)(TOPLONGBITONLY - 1)) /* 0x7FFFFFFFL */
```

Definition at line 250 of file [form3.h](#).

4.47.2.26 MAXPOSITIVE2

```
#define MAXPOSITIVE2 (MAXPOSITIVE / 2) /* 0x00003FFFL */
```

Definition at line 251 of file [form3.h](#).

4.47.2.27 MAXPOSITIVE4

```
#define MAXPOSITIVE4 (MAXPOSITIVE / 4) /* 0x00001FFFL */
```

Definition at line 252 of file [form3.h](#).

4.47.2.28 form_alignof

```
#define form_alignof(  
    type ) offsetof(struct { char c_; type x_; }, x_)
```

Definition at line 268 of file [form3.h](#).

4.47.2.29 WITHSORTBOTS

```
#define WITHSORTBOTS
```

Definition at line 288 of file [form3.h](#).

4.47.2.30 FILES

```
#define FILES FILE
```

Definition at line 372 of file [form3.h](#).

4.47.2.31 Uopen

```
#define Uopen(  
    x,  
    y ) fopen(x,y)
```

Definition at line 373 of file [form3.h](#).

4.47.2.32 Uflush

```
#define Uflush(  
    x ) fflush(x)
```

Definition at line 374 of file [form3.h](#).

4.47.2.33 Uclose

```
#define Uclose(  
    x ) fclose(x)
```

Definition at line 375 of file [form3.h](#).

4.47.2.34 Uread

```
#define Uread(  
    x,  
    y,  
    z,  
    u ) fread(x,y,z,u)
```

Definition at line 376 of file [form3.h](#).

4.47.2.35 Uwrite

```
#define Uwrite(  
    x,  
    y,  
    z,  
    u ) fwrite(x,y,z,u)
```

Definition at line 377 of file [form3.h](#).

4.47.2.36 Usetbuf

```
#define Usetbuf(  
    x,  
    y ) setbuf(x,y)
```

Definition at line 378 of file [form3.h](#).

4.47.2.37 Useek

```
#define Useek(  
    x,  
    y,  
    z ) fseek(x,y,z)
```

Definition at line 379 of file [form3.h](#).

4.47.2.38 Utell

```
#define Utell(  
    x ) ftell(x)
```

Definition at line 380 of file [form3.h](#).

4.47.2.39 Ugetpos

```
#define Ugetpos(  
    x,  
    y ) fgetpos(x,y)
```

Definition at line 381 of file [form3.h](#).

4.47.2.40 Usetpos

```
#define Usetpos(  
    x,  
    y ) fsetpos(x,y)
```

Definition at line 382 of file [form3.h](#).

4.47.2.41 Usync

```
#define Usync(  
    x ) fflush(x)
```

Definition at line 383 of file [form3.h](#).

4.47.2.42 Utruncate

```
#define Utruncate(  
    x ) _chsize(_fileno(x),0)
```

Definition at line 384 of file [form3.h](#).

4.47.2.43 Ustdout

```
#define Ustdout stdout
```

Definition at line 385 of file [form3.h](#).

4.47.2.44 MAX_OPEN_FILES

```
#define MAX_OPEN_FILES FOPEN_MAX
```

Definition at line 386 of file [form3.h](#).

4.47.2.45 bzero

```
#define bzero(  
    b,  
    len ) (memset((b), 0, (len)), (void)0)
```

Definition at line 387 of file [form3.h](#).

4.47.2.46 GetPID

```
#define GetPID( ) ((LONG)GetCurrentProcessId())
```

Definition at line 388 of file [form3.h](#).

4.47.3 Typedef Documentation

4.47.3.1 WORD

```
typedef int32_t WORD
```

Definition at line 196 of file [form3.h](#).

4.47.3.2 LONG

```
typedef int64_t LONG
```

Definition at line 197 of file [form3.h](#).

4.47.3.3 UWORD

```
typedef uint32_t UWORD
```

Definition at line 198 of file [form3.h](#).

4.47.3.4 ULONG

```
typedef uint64_t ULONG
```

Definition at line 199 of file [form3.h](#).

4.47.3.5 SBYTE

```
typedef signed char SBYTE
```

Definition at line 231 of file [form3.h](#).

4.47.3.6 UBYTE

```
typedef unsigned char UBYTE
```

Definition at line 232 of file [form3.h](#).

4.47.3.7 UINT

```
typedef unsigned int UINT
```

Definition at line 233 of file [form3.h](#).

4.47.3.8 RLONG

```
typedef ULONG RLONG
```

Definition at line 234 of file [form3.h](#).

4.47.3.9 MLONG

```
typedef int64_t MLONG
```

Definition at line 235 of file [form3.h](#).

4.47.3.10 BOOL

```
typedef char BOOL
```

Definition at line 240 of file [form3.h](#).

4.48 form3.h

4.51.1 Detailed Description

Contains the definitions of many internal codes Rather than using numbers directly we do this by defines, making it much easier to change things. Changing things is sometimes also a good way of testing the code.

Definition in file [ftypes.h](#).

4.51.2 Macro Definition Documentation

4.51.2.1 WITHOUTERROR

```
#define WITHOUTERROR 0
```

The next macros were introduced when TFORM was programmed. In the case of workers, each worker may need some private data. These can in principle be accessed by some posix calls but that is unnecessarily slow. The passing of a pointer to the complete data struct with private data will be much faster. And anyway, there would have to be a macro that either makes the posix call (TFORM) or doesn't (FORM). The solution by having macro's that either pass the pointer (TFORM) or don't pass it (FORM) is seen as the best solution.

In the declarations and the calling of the functions we have to use the PHEAD or the BHEAD macro, respectively, if the pointer is to be passed. These macro's contain the comma as well. Hence we need special macro's if there are no other arguments. These are called PHEAD0 and BHEAD0.

4.53.1 Detailed Description

The file with the central routines for the pattern matching of functions and their arguments. The file also contains the routines for the execution of the Symmetrize statement and its variations (like antisymmetrize etc).

Definition in file [function.c](#).

4.53.2 Function Documentation

4.53.2.1 MakeDirty()

```

int MakeDirty (
    WORD * term,
    WORD * x,
    WORD par )

```

Definition at line 51 of file [function.c](#).

4.53.2.2 MarkDirty()

```
void MarkDirty (
    WORD * term,
    WORD flags )
```

Definition at line 97 of file [function.c](#).

4.53.2.3 PolyFunDirty()

```
void PolyFunDirty (
    PHEAD WORD * term )
```

Definition at line 139 of file [function.c](#).

4.53.2.4 PolyFunClean()

```
void PolyFunClean (
    PHEAD WORD * term )
```

Definition at line 174 of file [function.c](#).

4.53.2.5 Symmetrize()

```
WORD Symmetrize (
    PHEAD WORD * func,
    WORD * Lijst,
    WORD ngroups,
    WORD gsize,
    WORD type )
```

Definition at line 213 of file [function.c](#).

4.53.2.6 CompGroup()

```
int CompGroup (
    PHEAD WORD type,
    WORD ** args,
    WORD * a1,
    WORD * a2,
    WORD num )
```

Definition at line 373 of file [function.c](#).

4.53.2.7 FullSymmetrize()

```
int FullSymmetrize (
    PHEAD WORD * fun,
    int type )
```

Definition at line 473 of file [function.c](#).

4.53.2.8 SymGen()

```
int SymGen (
    PHEAD WORD * term,
    WORD * params,
    WORD num,
    WORD level )
```

Definition at line 518 of file [function.c](#).

4.53.2.9 SymFind()

```
int SymFind (
    PHEAD WORD * term,
    WORD * params )
```

Definition at line 633 of file [function.c](#).

4.53.2.10 ChainIn()

```
int ChainIn (
    PHEAD WORD * term,
    WORD funnum )
```

Definition at line 691 of file [function.c](#).

4.53.2.11 ChainOut()

```
int ChainOut (
    PHEAD WORD * term,
    WORD funnum )
```

Definition at line 748 of file [function.c](#).

4.53.2.12 MatchFunction()

```
int MatchFunction (
    PHEAD WORD * pattern,
    WORD * interm,
    WORD * wilds )
```

Definition at line 826 of file [function.c](#).

4.53.2.13 ScanFunctions()

```
int ScanFunctions (
    PHEAD WORD * inpat,
    WORD * inter,
    WORD par )
```

Definition at line 1618 of file [function.c](#).

4.54 function.c

00802     #] ChainOut :
00803     #] Utilities :
00804     #] Patterns :
00805         #[] MatchFunction :          WORD MatchFunction(pattern,interm,wilds)
00806
00807         The routine assumes that the function numbers are the same.
00808         The contents are compared and a possible wildcard assignment
00809         is made. Note that it may be necessary to use a wildcard
00810         assignment stack to do things right.
00811         The routine can become arbitrarily complicated as there is
00812         no end to the possible wilddarding.
00813         Examples:
00814         - a: No wilddarding -> straight match
00815         - b: Individual arguments (object -> object)
00816         - c: whole arguments (object to subexpression)
00817         - d: any argumentlist
00818         - e: part of an argument (object inside subexpression)
00819
00820         The ones with a minus sign in front have been implemented.
00821
00822         Note: the argument wilds allows backtracking when multiple
00823         ?a,?b give a match that later turns out to be useless.

01574 /*
01575     #] MatchFunction :
01576     #[ ScanFunctions :          WORD ScanFunctions(inpat,inter,par)
01577
01578     Finds in which functions to look for a match.
01579     inpat is the start of the pattern still to be matched.
01580     inter is the start of the term still to be matched.
01581     par gives information about commutativity.
01582         par = 0: nothing special
01583         par = 1: regular noncommuting function
01584         par = 2: GAMMA function
01585
01586     AN.patstop: end of the functions field in the search pattern
01587     AN.terstop: end of the functions field in the target pattern
01588     AN.terstart: address of entire term;
01589
01590     The actual matching of the functions and their arguments is done
01591     in a number of different routines. Mainly MatchFunction when there
01592     are no symmetry properties.
01593     Also: MatchE
01594           MatchCy
01595           FunMatchSy
01596           FunMatchCy
01597
01598     The main problem here is backtracking, ie continuing with wildcard
01599     possibilities when a first assignment doesn't work.
01600     Important note: this was completely forgotten in the symmetric
01601     functions till 6-jan-2009. As of the moment this still has to
01602     be fixed.  ?????21-mar-2023????? Is this still unfixed?????
01603
01604     Functions inside functions can cause problems when antisymmetric
01605     functions are involved. The sign of the term may be at stake.
01606     At the lowest level this is no problem but in f(-fas(n2,n1)) this
01607     plays a role. Next is when we have a product of functions inside
01608     an argument. The strategy must be that we test the sign only at the
01609     last function. Hence, when inpat+inpat[1] >= AN.patstop.
01610     We might relax that to the last antisymmetric function at a later stage.
01611
01612     New scheme to be implemented for non-commuting objects:
01613     When we are matching a second (or higher) function, any match can only
01614     be directly after the last matched non-commuting function or a commuting
01615     function. This will take care of whatever happens in MatchE etc.
01616 */

4.62.1 Detailed Description

Routines for the dealing with if statements.

Definition in file [if.c](#).

4.62.2 Function Documentation

4.62.2.1 GetIfDollarNum()

```
WORD GetIfDollarNum (
    WORD * ifp,
    WORD * ifstop )
```

Definition at line [106](#) of file [if.c](#).

4.62.2.2 FindVar()

```
int FindVar (
    WORD * v,
    WORD * term )
```

Definition at line [173](#) of file [if.c](#).

4.62.2.3 DolfStatement()

```
int DoIfStatement (
    PHEAD WORD * ifcode,
    WORD * term )
```

Definition at line [280](#) of file [if.c](#).

4.62.2.4 HowMany()

```
WORD HowMany (
    PHEAD WORD * ifcode,
    WORD * term )
```

Definition at line [840](#) of file [if.c](#).

4.62.2.5 DoubleIfBuffers()

```
void DoubleIfBuffers (
    void )
```

Definition at line [1033](#) of file [if.c](#).

4.62.2.6 DoSwitch()

```
int DoSwitch (
    PHEAD WORD * term,
    WORD * lhs )
```

Definition at line [1070](#) of file [if.c](#).

4.62.2.7 DoEndSwitch()

```
int DoEndSwitch (
    PHEAD WORD * term,
    WORD * lhs )
```

Definition at line 1086 of file [if.c](#).

4.62.2.8 FindCase()

```
SWITCHTABLE * FindCase (
    WORD nswitch,
    WORD ncase )
```

Definition at line 1097 of file [if.c](#).

4.62.2.9 DoubleSwitchBuffers()

```
int DoubleSwitchBuffers (
    void )
```

Definition at line 1135 of file [if.c](#).

4.62.2.10 SwitchSplitMergeRec()

```
void SwitchSplitMergeRec (
    SWITCHTABLE * array,
    WORD num,
    SWITCHTABLE * auxarray )
```

Definition at line 1184 of file [if.c](#).

4.62.2.11 SwitchSplitMerge()

```
void SwitchSplitMerge (
    SWITCHTABLE * array,
    WORD num )
```

Definition at line 1213 of file [if.c](#).

00029 */
00030 /* #[ License : */
00031 /*
00032     #[ Includes : if.c
00033 */
00034
00035 #include "form3.h"
00036
00037 /*
00038     #[ Includes :
00039     #[ If statement :
00040         #[ Syntax :
00041
00042         The `if' is a conglomerate of statements: if,else,endif
00043
00044         The if consists in principle of:
00045
00046         if ( number );
00047             statements
00048         else;
00049             statements
00050         endif;
00051
00052         The first set is taken when number != 0.
00053         The else is not mandatory.
00054         TRUE = 1 and FALSE = 0
00055
00056         The number can be built up via a logical expression:
00057
00058             expr1 condition expr2
00059
00060         each expression can be a subexpression again. It has to be
00061         enclosed in parentheses in that case.
00062         Conditions are:
00063             >, >=, <, <=, ==, !=, ||, &&
00064
00065         When Expressions are chained evaluation is from left to right,
00066         independent of whether this indicates nonsense.
00067         if ( a || b || c || d ); is a perfectly normal statement.
00068         if ( a >= b || c == d ); would be messed up. This should be:
00069         if ( ( a >= b ) || ( c == d ) );
00070
00071         The building blocks of the Expressions are:
00072
00073             Match(option,pattern)   The number of times pattern fits in term_
00074             Count(...)              The count value of term_
00075             Coeff[icient]           The coefficient of term_
00076             FindLoop(options)       Are there loops (as in ReplaceLoop).
00077
00078         Implementation for internal notation:
00079
00080         TYPEIF,length,gotolevel(if fail),EXPRTYPE,length,.....
00081
00082         EXPRTYPE can be:
00083             SHORTNUMBER             ->,4,sign,size
00084             LONGNUMBER              ->,|ncoef+2|,ncoef,numer,denom
00085             MATCH                   ->,patternsiz+3,keyword,pattern

```

```

00086      MULTIPLEOF      ->,3,thenumber
00087      COUNT           ->,countsiz+2,countinfo
00088      TYPEFINDLOOP    ->,7 (findloop info)
00089      COEFFICIENT      ->,2
00090      IFDOLLAR         ->,3,dollarnumber
00091      SUBEXPR         ->,size,dummy,size1,EXPRTYPE,length,...
00092                      ,2,condition1,size2,...
00093                      This is like functions.
00094
00095      Note that there must be a restriction to the number of nestings
00096      of parentheses in an if statement. It has been set to 10.
00097
00098      The syntax of match corresponds to the syntax of the left side
00099      of an id statement. The only difference is the keyword
00100      MATCH vs TYPEIDNEW.
00101
00102      #] Syntax :

00041 /*
00042     #] Includes :
00043     #[ syntax and use :
00044
00045     The indexing of brackets is not automatic! It should only be used
00046     when one intends to use the contents of individual brackets.
00047     This is done with the addition of a + sign to the bracket statement:
00048     B+ a,b,c; or AB+ a,b,c;
00049     It does require resources! The index is kept in memory and is removed
00050     once the expression is treated and passed on to the output with different
00051     or no brackets.
00052     The index is limited to a given amount of space. Hence if there are too
00053     many brackets we will skip some in the index. Skipping goes by space
00054     occupied by the contents. We take the two adjacent bracket(s) with the
00055     least space together and represent them by the first one only. This gives
00056     a new spot.
00057     The expression struct has two pointers:
00058     bracketinfo      for using.
00059     newbracketinfo   for making new index.
00060

4.68.1 Detailed Description

Routines to find loops in index contractions. These routines allow for a category of topological statements. They were originally developed for the color library.

Definition in file [lus.c](#).

4.68.2 Function Documentation

4.68.2.1 Lus()

```

int Lus (
    WORD * term,
    WORD funnum,
    WORD loopsize,
    WORD numargs,
    WORD outfun,
    WORD mode )

```

Definition at line 57 of file [lus.c](#).

4.68.2.2 FindLus()

```
int FindLus (
    int from,
    int level,
    int openindex )
```

Definition at line [515](#) of file [lus.c](#).

4.68.2.3 SortTheList()

```
int SortTheList (
    int * slist,
    int num )
```

Definition at line [578](#) of file [lus.c](#).

4.68.2.4 AllLoops()

```
int AllLoops (
    PHEAD WORD * term,
    WORD level )
```

Definition at line [650](#) of file [lus.c](#).

4.68.2.5 StartLoops()

```
LONG StartLoops (
    PHEAD WORD * term,
    WORD level,
    LONG vert,
    WORD nvert,
    WORD * arglist,
    WORD nargs,
    WORD * loop,
    WORD nloop )
```

Definition at line [894](#) of file [lus.c](#).

4.68.2.6 GenLoops()

```
LONG GenLoops (
    PHEAD WORD * term,
    WORD level,
    LONG vert,
    WORD nvert,
    WORD * arglist,
    WORD nargs,
    WORD * loop,
    WORD nloop )
```

Definition at line [980](#) of file [lus.c](#).

4.68.2.7 LoopOutput()

```
void LoopOutput (
    PHEAD WORD * term,
    WORD level,
    WORD * loop,
    WORD nloop )
```

Definition at line [1059](#) of file [lus.c](#).

4.68.2.8 AllPaths()

```
int AllPaths (
    PHEAD WORD * term,
    WORD level )
```

Definition at line [1123](#) of file [lus.c](#).

4.68.2.9 GenPaths()

```
LONG GenPaths (
    PHEAD WORD * term,
    WORD level,
    LONG vert,
    WORD nvert,
    WORD * arglist,
    WORD nargs,
    WORD * path,
    WORD npath )
```

Definition at line [1413](#) of file [lus.c](#).

4.68.2.10 PathOutput()

```
void PathOutput (
    PHEAD WORD * term,
    WORD level,
    WORD * path,
    WORD npath )
```

Definition at line [1486](#) of file [lus.c](#).

4.68.2.11 AllOnePI()

```
WORD AllOnePI (
    WORD * term,
    WORD level )
```

Definition at line [1566](#) of file [lus.c](#).

4.68.2.12 RemoveBridges()

```
int RemoveBridges (
    void )
```

Definition at line 1586 of file [lus.c](#).

4.68.2.13 TakeOneLine()

```
int TakeOneLine (
    WORD * term,
    WORD level )
```

Definition at line 1596 of file [lus.c](#).

4.68.2.14 OutputOnePI()

```
int OutputOnePI (
    PHEAD WORD * term,
    WORD level )
```

Definition at line 1608 of file [lus.c](#).

4.69 lus.c

00624 #] SortTheList :
00625 #[ AllLoops :
00626
00627 Routine finds all possible loops that can be made in the
00628 arguments of the symmetric commuting vertex function v and creates
00629 for each loop a new term which is the original term times the loop.
00630 The occurrences of v can have different numbers of arguments.
00631 Each argument that occurs twice (and in different instances of v)
00632 in total will be considered.
00633
00634 The input parameters are in C->lhs[level] and are
00635 C->lhs[level][0] TYPEALLLOOPS
00636 C->lhs[level][1] 6
00637 C->lhs[level][2] Number of function v.
00638 C->lhs[level][3] Number of the output function loop.
00639 C->lhs[level][4] option1: the type of argument.
00640 C->lhs[level][5] option2: 0,1: what to do if no loop.
00641 Eligible arguments must be of the type SYMBOL, VECTOR, INDEX or SNUMBER.
00642 They must all be of the same type, indicated by option1.
00643 Extra restriction: In a loop, each v can be visited at most once.
00644 If there is no loop at all, option2 determines whether the term
00645 remains unmodified, or is replaced by zero.
00646 Function v can be either a regular function or a tensor.
00647 To facilitate this we copy the relevant arguments into the workspace.

00836 id v(?a,i?,?b,i?,?c) = v(?a,?b,?c)
00837 there is no need to avoid them as potential loops.
00838
00839 At this point we are ready to look for loops.
00840 We have
00841     arglist,nargs    list of eligible objects.
00842     vert,nvert       position in pWorkspace for vertices and their number.
00843                     The vertices themselves are in the Workspace.
00844     loop,nloop       The buildup of the loop.
00845 */
00846 loop = AT.WorkPointer;
00847 AT.WorkPointer += nargs;
00848 nloop = 0;
00849 numgenerated += StartLoops(BHEAD term,level,vert,nvert,arglist,nargs,loop,nloop);
00850 AT.WorkPointer = oldworkpointer;
00851 AT.pWorkPointer = oldpworkpointer;
00852
00853 if ( numgenerated == 0 && option2 != 0 ) return(Generator(BHEAD term,level));
00854 return(0);
00855 }
00856
00857 /*
00858 #] AllLoops :
00859 #[ StartLoops :
00860
00861 Algorithm.
00862 1: have a list of vertices and objects that can be part of the loops.
00863 2: starting with the first element of arglist, look for the two
00864    vertices that contain this object. The first is vstart.
00865 3: At the second, look at all possible objects to continue from here.
00866 4: For each, find the vertex with its partner.
00867 5: if the partner vertex is vstart, we have a loop. --> 9.
00868 6: The partner vertex is not allowed to be a vertex that we passed
00869    in the current build-up of the loop.
00870 7: Put the object in loop and increase nloop.
00871 8: Now sum over all allowed objects in the partner vertex. --> 4.
00872
00873 9: Create the function loop with the arguments from loop,nloop.
00874 10: If a reverse cyclic permutation gives a smaller result, drop this
00875     solution and continue with the last summing over objects at a vertex.
00876 11: If not, output the result by adding the function loop
00877     to the term and call Generator(term,level)
00878
00879 12: when all possibilities with the first element of arglist have been
00880     exhausted, raise arglist and lower nargs by one. --> 2
00881 13: when nargs == 1, we can stop.
00882
00883 The inclusion of a new object when we sum over the possibilities at a
00884 vertex can best be done in a recursion, because we have no idea how
00885 many nested loops we would otherwise need. Of course the recursion can
00886 be emulated, but that makes the algorithm rather messy.
00887
00888 We have two routines: StartLoops and GenLoops.
00889 StartLoops takes care of the first argument (and the summing over who
00890 is the first argument), while GenLoops treats an additional vertex until
00891 a loop is closed. GenLoops also sends completed loops off to Generator.

01533
01534 We assume a graph that has loops and is OnePI.
01535 This routine initializes the recursion that creates all onePI subgraphs.
01536
01537 Algorithm:
01538     a: have a routine that removes all bridges: RemoveBridges
01539     b: output an empty diagram.
01540     c: output the diagram itself
01541     d: cut a line, followed by removing all bridges.
01542     e: if the diagram still has lines, go to c, else go to the next line in d.
01543 In order to avoid factorial blowup, we need to prune the tree as fast as possible.
01544
01545 1: list of lines to be cut.
01546 2: once we have tried a line and removed its bridges, we do not have to
01547    try this line deeper in the tree, neither its bridges.
01548
01549
01550 1 2 3
01551     cut 1.                x
01552         cut 2 -> bridge 3    x
01553     cut 2.                x
01554         cut 3 -> bridge 1    ??? mag niet
01555     cut 3.                x
01556 Hence 1,2,3,4,5,6,7
01557     1 still to go 2,3,4,5,6,7
01558     2 still to go 3,4,5,6,7
01559     3 still to go 4,5,6,7
01560     etc.
01561 bridges: if x is bridge, we take x from the list_to_go.
01562 If we have a bridge that is a number lower than the list_to_go we skip this possibility.
01563 We reach the end when the list_to_go is empty.

00037 /*
00038  #] Documentation :
00039
00040 The enhanced malloc debugger. It intercepts access (both write AND
00041 read) to the memory outside the allocated chunk in the following
00042 manner: it prints out (to the stderr) the information about the event
00043 and goes to the spillock. The user is able to attach the debugger to
00044 the running process, investigate the problem and continue evaluation.
00045
00046 In case of error, the debugger will print to the stderr the following
00047 information:
00048 "***** PID: ###, Addr: ###, signal ### (code ###)"
00049 "Attach gdb -p ### and set var loopForever=0 in a corresponding frame to continue"
00050 or for TFORM:
00051 "Attach gdb -p ### and set var loopForever=0 in a corresponding frame
00052   of a thread with LPW id ### to continue"
00053
00054 and go to the spillock. The user may attach gdb by the command
00055 gdb -p ### and type "where" (in case of TFORM, the user should first
00056 switch to the proper thread). Then investigation of the corresponding
00057 frames should clarify the situation. In order to continue the program,
00058 the user might set (in the corresponding frame of the corresponding
00059 thread) the variable loopForever to 0. The debugger will try to remove
00060 local problem lead to the exception.
00061
00062 To activate the debugger, the macro MALLOCPROTECT should be
00063 defined. There are three possible values:
00064 #define MALLOCPROTECT -1 (any integer <0)
00065 #define MALLOCPROTECT 0
00066 #define MALLOCPROTECT 1 (any integer>0)
00067
00068 If MALLOCPROTECT < 0, the debugger will intercept any access to the
00069 memory before the allocated chunk, even one byte.
00070
00071 If MALLOCPROTECT == 0, the debugger will intercept any access to the
00072 memory before the allocated chunk, even one byte, and access to the
00073 memory page next to the allocated one.
00074
00075 If MALLOCPROTECT > 0, the debugger will intercept any access to the
00076 memory after the allocated chunk, even one byte, and access to the
00077 memory page before the allocated one.
00078
00079 The original FORM malloc debugger is able to catch errors when the

```

```

00080 allocated memory is freed improper, or if some small portion OUT of
00081 the allocated chunk is written. This debugger is a complementary
00082 one. It permits to catch situation when some small portion of memory
00083 before or after the allocated chunk is written or even just read.
00084
00085 The idea is to protect the beginning or the end of the allocated chunk
00086 for any kind of access and install the SIGSEGV handler in order to
00087 intercept the access to this memory. Moreover, the allocated memory is
00088 always immediately returned to the system so if the user tries to
00089 access the memory after it is freed then the handler is triggered,
00090 also.
00091
00092 The problem here is that we are able to allocate / protect only the
00093 whole page. So the user has to run the debugger twice: one time with
00094 the left alignment (#define MALLOC_PROTECT <0), and then with the right
00095 alignment (#define MALLOC_PROTECT >0). During the first run the possible
00096 errors like x[-1] will be caught, and the second run will manifest
00097 reading over the allocated ares.
00098
00099 The leftmost extra page is always allocated and protected. The size
00100 of the allocated chunk is stored in the beginning of this page.

4.71.1 Detailed Description

Contains the routines that write messages. This includes the very important routine MesPrint which is the FORM equivalent of printf but then with escape sequences that are relevant for symbolic manipulation. The FORM statement Print "..." is passed almost literally to MesPrint.

Definition in file [message.c](#).

4.71.2 Function Documentation

4.71.2.1 Error0()

```
void Error0 (  
    char * s )
```

Definition at line 56 of file [message.c](#).

4.71.2.2 Error1()

```
void Error1 (  
    char * s,  
    UBYTE * t )
```

Definition at line 67 of file [message.c](#).

4.71.2.3 Error2()

```
void Error2 (  
    char * s1,  
    char * s2,  
    UBYTE * t )
```

Definition at line 78 of file [message.c](#).

4.71.2.4 MesWork()

```
int MesWork (
    void )
```

Definition at line 89 of file [message.c](#).

4.71.2.5 MesPrint()

```
int MesPrint (
    va_alist )
```

Definition at line 140 of file [message.c](#).

4.71.2.6 Warning()

```
void Warning (
    char * s )
```

Definition at line 790 of file [message.c](#).

4.71.2.7 HighWarning()

```
void HighWarning (
    char * s )
```

Definition at line 802 of file [message.c](#).

4.71.2.8 MesCall()

```
int MesCall (
    char * s )
```

Definition at line 814 of file [message.c](#).

4.71.2.9 MesCerr()

```
int MesCerr (
    char * s,
    UBYTE * t )
```

Definition at line 824 of file [message.c](#).

4.71.2.10 MesComp()

```
int MesComp (
    char * s,
    UBYTE * p,
    UBYTE * q )
```

Definition at line 843 of file [message.c](#).

4.71.2.11 PrintTerm()

```
void PrintTerm (
    WORD * term,
    char * where )
```

Definition at line [857](#) of file [message.c](#).

4.71.2.12 PrintTermC()

```
void PrintTermC (
    WORD * term,
    char * where )
```

Definition at line [887](#) of file [message.c](#).

4.71.2.13 PrintSubTerm()

```
void PrintSubTerm (
    WORD * term,
    char * where )
```

Definition at line [921](#) of file [message.c](#).

4.71.2.14 PrintWords()

```
void PrintWords (
    WORD * buffer,
    LONG number )
```

Definition at line [943](#) of file [message.c](#).

4.71.2.15 PrintSeq()

```
void PrintSeq (
    WORD * a,
    char * text )
```

Definition at line [961](#) of file [message.c](#).

00101     Kind of a printf function for simple messages.
00102     The main concern is getting the arguments in a portable way.
00103     Note: many compilers have errors when sizeof(WORD) < sizeof(int)
00104     %a array of size n WORDs (two parameters, first is int, second WORD *)
00105     %b array of size n UBYTES (two parameters, first is int, second UBYTE *)
00106     %C array of size n chars (two parameters, first is int, second char *)
00107     %d word;
00108     %l long;
00109     %L long long *;
00110     %s string;
00111     %#i unsigned word filled
00112     %#d word positioned
00113     %#l long word positioned.
00114     %#L long long word * positioned.
00115     %#s string positioned.
00116     %#p position in file.
00117     %r The current term in raw format (internal representation)
00118     %t The current term (AN.currentTerm)
00119     %T The current term (AN.currentTerm) with its sign
00120     %w Number of the thread(worker)
00121     %$ The next $ in AN.listinprint
00122     %x hexadecimal. Takes 8 places. Mainly for debugging.
00123     %% %
00124     %# #
00125     # " ==> "
00126     @ " ==> " Preprocessor error
00127     & ' --> ' Regular compiler error
00128     Each call is terminated with a new line.
00129     Put a % at the end of the string to suppress the new line.
00130
00131     New feature (7-dec-2011): The & will only work when we do not block it
00132     from the execution of the print statement because we need the & also for
00133     the tabulator in the print "" statement.

4.73.1 Detailed Description

These are the low level functions for the database part of the tablebases. These routines have been copied (and then adapted) from the minos database program. This file goes together with [minos.h](#)

Definition in file [minos.c](#).

4.73.2 Macro Definition Documentation

4.73.2.1 CFD

```
#define CFD(
    y,
    s,
    type,
    x,
    j )
```

Value:

```
for(x=0, j=0; j<((int) sizeof(type)); j++) \
{ x=(x<<8)+((*(s++)&0x00FF)); } y=x;
```

Definition at line 55 of file [minos.c](#).

4.73.2.2 CTD

```
#define CTD(
    y,
    s,
    type,
    x,
    j )
```

Value:

```
x=y; for(j=sizeof(type)-1; j>=0; j--) { s[j]=x&0xFF; \
x>>=8; } s += sizeof(type);
```

Definition at line 57 of file [minos.c](#).

4.73.3 Function Documentation

4.73.3.1 minosread()

```
int minosread (
    FILE * f,
    char * buffer,
    MLONG size )
```

Definition at line 66 of file [minos.c](#).

4.73.3.2 minoswrite()

```
int minoswrite (
    FILE * f,
    char * buffer,
    MLONG size )
```

Definition at line 83 of file [minos.c](#).

4.73.3.3 str_dup()

```
char * str_dup (
    char * str )
```

Definition at line 101 of file [minos.c](#).

4.73.3.4 convertblock()

```
void convertblock (
    INDEXBLOCK * in,
    INDEXBLOCK * out,
    int mode )
```

Definition at line 120 of file [minos.c](#).

4.73.3.5 convertnamesblock()

```
void convertnamesblock (
    NAMESBLOCK * in,
    NAMESBLOCK * out,
    int mode )
```

Definition at line 171 of file [minos.c](#).

4.73.3.6 convertiniinfo()

```
void convertiniinfo (
    INIINFO * in,
    INIINFO * out,
    int mode )
```

Definition at line 197 of file [minos.c](#).

4.73.3.7 LocateBase()

```
FILE * LocateBase (
    char ** name,
    char ** newname,
    char * iomode )
```

Definition at line 225 of file [minos.c](#).

4.73.3.8 ReadIndex()

```
int ReadIndex (
    DBASE * d )
```

Definition at line 288 of file [minos.c](#).

4.73.3.9 WriteIndexBlock()

```
int WriteIndexBlock (
    DBASE * d,
    MLONG num )
```

Definition at line 399 of file [minos.c](#).

4.73.3.10 WriteNamesBlock()

```
int WriteNamesBlock (
    DBASE * d,
    MLONG num )
```

Definition at line 420 of file [minos.c](#).

4.73.3.11 WriteIndex()

```
int WriteIndex (
    DBASE * d )
```

Definition at line 443 of file [minos.c](#).

4.73.3.12 WriteIniInfo()

```
int WriteIniInfo (
    DBASE * d )
```

Definition at line 506 of file [minos.c](#).

4.73.3.13 ReadIniInfo()

```
int ReadIniInfo (
    DBASE * d )
```

Definition at line 523 of file [minos.c](#).

4.73.3.14 GetDbase()

```
DBASE * GetDbase (
    char * filename,
    MLONG rwmode )
```

Definition at line 546 of file [minos.c](#).

4.73.3.15 NewDbase()

```
DBASE * NewDbase (
    char * name,
    MLONG number )
```

Definition at line 602 of file [minos.c](#).

4.73.3.16 FreeTableBase()

```
void FreeTableBase (
    DBASE * d )
```

Definition at line 739 of file [minos.c](#).

4.73.3.17 ComposeTableNames()

```
int ComposeTableNames (
    DBASE * d )
```

Definition at line 771 of file [minos.c](#).

4.73.3.18 OpenDbase()

```
DBASE * OpenDbase (
    char * filename )
```

Definition at line 820 of file [minos.c](#).

4.73.3.19 AddTableName()

```
MLONG AddTableName (
    DBASE * d,
    char * name,
    TABLES T )
```

Definition at line 854 of file [minos.c](#).

4.73.3.20 GetTableName()

```
MLONG GetTableName (
    DBASE * d,
    char * name )
```

Definition at line 937 of file [minos.c](#).

4.73.3.21 PutTableNames()

```
int PutTableNames (
    DBASE * d )
```

Definition at line 969 of file [minos.c](#).

4.73.3.22 AddToIndex()

```
int AddToIndex (
    DBASE * d,
    MLONG number )
```

Definition at line 1065 of file [minos.c](#).

4.73.3.23 AddObject()

```
MLONG AddObject (
    DBASE * d,
    MLONG tablename,
    char * arguments,
    char * rhs )
```

Definition at line 1152 of file [minos.c](#).

4.73.3.24 FindTableNumber()

```
MLONG FindTableNumber (
    DBASE * d,
    char * name )
```

Definition at line 1166 of file [minos.c](#).

4.73.3.25 WriteObject()

```
int WriteObject (
    DBASE * d,
    MLONG tablenumber,
    char * arguments,
    char * rhs,
    MLONG number )
```

Definition at line 1194 of file [minos.c](#).

4.73.3.26 ReadObject()

```
char * ReadObject (
    DBASE * d,
    MLONG tablenumber,
    char * arguments )
```

Definition at line 1294 of file [minos.c](#).

4.73.3.27 ReadijObject()

```
char * ReadijObject (
    DBASE * d,
    MLONG i,
    MLONG j,
    char * arguments )
```

Definition at line 1375 of file [minos.c](#).

4.73.3.28 ExistsObject()

```
int ExistsObject (
    DBASE * d,
    MLONG tablenumber,
    char * arguments )
```

Definition at line 1427 of file [minos.c](#).

4.73.3.29 DeleteObject()

```
int DeleteObject (
    DBASE * d,
    MLONG tablenumber,
    char * arguments )
```

Definition at line 1459 of file [minos.c](#).

4.73.4 Variable Documentation

4.73.4.1 withoutflush

```
int withoutflush = 0
```

Definition at line 45 of file [minos.c](#).

4.75.1 Detailed Description

Contains all needed declarations and definitions for the tablebase low level file routines. These have been taken from the minos database system and modified somewhat.

!!!CAUTION!!! Changes in this file will most likely have consequences for the recovery mechanism (see [checkpoint.c](#)). You need to care for the code in [checkpoint.c](#) as well and modify the code there accordingly!

Definition in file [minos.h](#).

4.75.2 Macro Definition Documentation

4.75.2.1 TODISK

```
#define TODISK 0

4.77.1 Detailed Description

Implementation of "Model", required by the `diagrams_` function.

Definition in file [model.c](#).

4.77.2 Function Documentation

4.77.2.1 CreateVertex()

```
VERTEX * CreateVertex (
    MODEL * m )
```

Definition at line 76 of file [model.c](#).

4.77.2.2 ReadParticle()

```
UBYTE * ReadParticle (
    UBYTE * s,
    VERTEX * v,
    MODEL * m,
    int par )
```

Definition at line 106 of file [model.c](#).

4.77.2.3 CoModel()

```
int CoModel (
    UBYTE * s )
```

Definition at line 149 of file [model.c](#).

4.77.2.4 CoParticle()

```
int CoParticle (
    UBYTE * s )
```

Definition at line 224 of file [model.c](#).

4.77.2.5 CoVertex()

```
int CoVertex (
    UBYTE * s )
```

Definition at line 306 of file [model.c](#).

4.77.2.6 CoEndModel()

```
int CoEndModel (
    UBYTE * s )
```

Definition at line 409 of file [model.c](#).

4.78 model.c

00031 /*
00032 *   #[ Explanations :
00033 *
00034 *   This is a second generation much simplified version of model.c
00035 *   Syntax:
00036 *       Model QED;
00037 *           Particle electron,positron,-2;
00038 *           Particle photon,+3;
00039 *           Vertex electron,positron,photon: g;
00040 *       EndModel;
00041 *   or:
00042 *       Model QCD;
00043 *           Particle quark,antiquark,-2;
00044 *           Particle ghost,antighost,-1;
00045 *           Particle gluon,+3;
00046 *           Vertex quark,antiquark,gluon: g;
00047 *           Vertex qhost,antighost,gluon: g;
00048 *           Vertex gluon,gluon,gluon: g;
00049 *           Vertex gluon,gluon,gluon,gluon: g^2;
00050 *       EndModel;
00051 *   Remarks:
00052 *   1: if no second particle is given, a particle and its antiparticle are the same
00053 *   2: Spin statistics is by dimension of SU(2) representation with a sign.
00054 *   3: In a vertex we need to mention the coupling constants.
00055 *   4: Internally a particle gives a vertex with only two lines.
00056 *   5: All particles must have been declared before any vertex.
00057 *
00058 *   The diagrams should be provided as a collection of nodes and edges
00059 *   with momenta with a direction substituted. The other parameters (like
00060 *   Lorentz indices, color indices etc.) can then be provided in a procedure
00061 *   that should go with this mode definition.
00062 *   In principle the edges are not needed if there are no 'insertions', but
00063 *   because we would like to have the insertions as well we need the edges.
00064 *

4.79.1 Detailed Description

A number of routines that deal with the moduleoption statement and the execution of modules. Additionally there are the execution of the exec and pipe instructions.

Definition in file [module.c](#).

4.79.2 Function Documentation

4.79.2.1 ModuleInstruction()

```
int ModuleInstruction (
    int * moduletype,
    int * specialtype )
```

Definition at line 76 of file [module.c](#).

4.79.2.2 CoModuleOption()

```
int CoModuleOption (
    UBYTE * s )
```

Definition at line 143 of file [module.c](#).

4.79.2.3 CoModOption()

```
int CoModOption (
    UBYTE * s )
```

Definition at line 212 of file [module.c](#).

4.79.2.4 SetSpecialMode()

```
void SetSpecialMode (
    int moduletype,
    int specialtype )
```

Definition at line 257 of file [module.c](#).

4.79.2.5 ExecModule()

```
int ExecModule (
    int moduletype )
```

Definition at line [274](#) of file [module.c](#).

4.79.2.6 ExecStore()

```
int ExecStore (
    void )
```

Definition at line [299](#) of file [module.c](#).

4.79.2.7 FullCleanUp()

```
void FullCleanUp (
    void )
```

Definition at line [314](#) of file [module.c](#).

4.79.2.8 DoPolyfun()

```
int DoPolyfun (
    UBYTE * s )
```

Definition at line [395](#) of file [module.c](#).

4.79.2.9 DoPolyratfun()

```
int DoPolyratfun (
    UBYTE * s )
```

Definition at line [458](#) of file [module.c](#).

4.79.2.10 DoNoParallel()

```
int DoNoParallel (
    UBYTE * s )
```

Definition at line [529](#) of file [module.c](#).

4.79.2.11 DoParallel()

```
int DoParallel (
    UBYTE * s )
```

Definition at line [544](#) of file [module.c](#).

4.79.2.12 DoModSum()

```
int DoModSum (
    UBYTE * s )
```

Definition at line 559 of file [module.c](#).

4.79.2.13 DoModMax()

```
int DoModMax (
    UBYTE * s )
```

Definition at line 579 of file [module.c](#).

4.79.2.14 DoModMin()

```
int DoModMin (
    UBYTE * s )
```

Definition at line 599 of file [module.c](#).

4.79.2.15 DoModLocal()

```
int DoModLocal (
    UBYTE * s )
```

Definition at line 619 of file [module.c](#).

4.79.2.16 DoProcessBucket()

```
int DoProcessBucket (
    UBYTE * s )
```

Definition at line 639 of file [module.c](#).

4.79.2.17 DoModDollar()

```
UBYTE * DoModDollar (
    UBYTE * s,
    int type )
```

Definition at line 657 of file [module.c](#).

4.79.2.18 DoinParallel()

```
int DoinParallel (
    UBYTE * s )
```

Definition at line 758 of file [module.c](#).

4.79.2.19 DonotinParallel()

```
int DonotinParallel (
    UBYTE * s )
```

Definition at line 768 of file [module.c](#).

4.79.2.20 DoExecStatement()

```
int DoExecStatement (
    void )
```

Definition at line 780 of file [module.c](#).

4.79.2.21 DoPipeStatement()

```
int DoPipeStatement (
    void )
```

Definition at line 797 of file [module.c](#).

4.81.1 Detailed Description

MPI dependent functions of perform

This file contains all the functions for the parallel version of form3 that explicitly need to call mpi routines. This is the only file that really needs to be linked to the mpi-library!

Definition in file [mpi.c](#).

4.81.2 Macro Definition Documentation

4.81.2.1 PF_PACKSIZE

```
#define PF_PACKSIZE 1600
```

Definition at line 58 of file [mpi.c](#).

4.81.2.2 MPI_ERRCODE_CHECK

```
#define MPI_ERRCODE_CHECK(  
    err )
```

Value:

```
do { \
    int _tmp_err = (err); \
    if ( _tmp_err != MPI_SUCCESS ) return _tmp_err != 0 ? _tmp_err : -1; \
} while (0)
```

A macro which exits the caller with a non-zero return value if *err* is not MPI_SUCCESS.

Parameters

<i>err</i>	The return value of a MPI function to be checked.
------------	---

Remarks

The MPI standard defines MPI_SUCCESS == 0. Then (*_tmp_err* == 0) appears twice and we can expect the second evaluation will be eliminated by the compiler optimization.

Definition at line 84 of file [mpi.c](#).

4.81.3 Function Documentation

4.81.3.1 PF_RealTime()

```
LONG PF_RealTime (  
    int i )
```

Returns the realtime in 1/100 sec. as a LONG.

Parameters

<i>i</i>	the timer will be reset if <code>i == 0</code> .
----------	--

Returns

the real elapsed time in 1/100 second.

Definition at line 101 of file [mpi.c](#).

Referenced by [PF_Init\(\)](#).

4.81.3.2 PF_LibInit()

```
int PF_LibInit (
    int * argcp,
    char *** argvp )
```

Performs all library dependent initializations.

Parameters

<i>argcp</i>	pointer to the number of arguments.
<i>argvp</i>	pointer to the arguments.

Returns

0 if OK, nonzero on error.

Definition at line 123 of file [mpi.c](#).

Referenced by [PF_Init\(\)](#).

4.81.3.3 PF_LibTerminate()

```
int PF_LibTerminate (
    int error )
```

Exits mpi, when there is an error either indicated or happening, returnvalue is 1, else returnvalue is 0.

Parameters

<i>error</i>	an error code.
--------------	----------------

Returns

0 if OK, nonzero on error.

Definition at line 209 of file [mpi.c](#).

Referenced by [PF_Terminate\(\)](#).

4.81.3.4 PF_Probe()

```
int PF_Probe (
    int * src )
```

Probes the next incoming message. If `src == PF_ANY_SOURCE` this operation is blocking, otherwise nonblocking.

Parameters

<i>in, out</i>	<i>src</i>	the source process number. In output, the process number of actual found source.
----------------	------------	--

Returns

the tag value of the next incoming message if found, 0 if a nonblocking probe (input `src != PF_ANY_SOURCE`) did not find any messages. A negative returned value indicates an error.

Definition at line [230](#) of file [mpi.c](#).

4.81.3.5 PF_ISEND(buf)

```
int PF_ISEND (
    int to,
    int tag )
```

Nonblocking send operation. It sends everything from `buf` to `fill` of the active buffer. Depending on `tag` it also can do waiting for other sends to finish or set the active buffer to the next one.

Parameters

<i>to</i>	the destination process number.
<i>tag</i>	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line [261](#) of file [mpi.c](#).

Referenced by [FlushOut\(\)](#), [PF_Processor\(\)](#), and [PutOut\(\)](#).

4.81.3.6 PF_RECV(buf)

```
int PF_RECV (
    WORD * b,
    LONG * s,
    int * src )
```

Blocking receive of a `WORD` buffer.

Parameters

<i>out</i>	<i>b</i>	the buffer to store the received data.
<i>in, out</i>	<i>s</i>	the size of the buffer. The output value is the actual size of the received data.
<i>in, out</i>	<i>src</i>	the source process number. The output value is the process number of actual source.

Returns

the received message tag. A negative value indicates an error.

Definition at line 337 of file [mpi.c](#).

4.81.3.7 PF_IRecvRbuf()

```
int PF_IRecvRbuf (
    PF_BUFFER * r,
    int bn,
    int from )
```

Posts nonblocking receive for the active receive buffer. The buffer is filled from `full` to `stop`.

Parameters

<i>r</i>	the PF_BUFFER struct for the nonblocking receive.
<i>bn</i>	the index of the cyclic buffer.
<i>from</i>	the source process number.

Returns

0 if OK, nonzero on error.

Definition at line 366 of file [mpi.c](#).

4.81.3.8 PF_WaitRbuf()

```
int PF_WaitRbuf (
    PF_BUFFER * r,
    int bn,
    LONG * size )
```

Waits for the buffer *bn* to finish a pending nonblocking receive. It returns the received tag and in **size* the number of field received. If the receive is already finished, just return the flag and size, else wait for it to finish, but also check for other pending receives.

Parameters

	<i>r</i>	the PF_BUFFER struct for the pending nonblocking receive.
	<i>bn</i>	the index of the cyclic buffer.
<i>out</i>	<i>size</i>	the actual size of received data.

Returns

the received message tag. A negative value indicates an error.

Definition at line 400 of file [mpi.c](#).

4.81.3.9 PF_Bcast()

```
int PF_Bcast (
    void * buffer,
    int count )
```

Broadcasts a message from the master to slaves.

Parameters

<i>in, out</i>	<i>buffer</i>	the starting address of buffer. The contents in this buffer on the master will be transferred to those on the slaves.
	<i>count</i>	the length of the buffer in bytes.

Returns

0 if OK, nonzero on error.

Definition at line 440 of file [mpi.c](#).

Referenced by [PF_BroadcastBuffer\(\)](#), and [PF_BroadcastNumber\(\)](#).

4.81.3.10 PF_RawSend()

```
int PF_RawSend (
    int dest,
    void * buf,
    LONG l,
    int tag )
```

Sends *l* bytes from *buf* to *dest*. Returns 0 on success, or -1.

Parameters

<i>dest</i>	the destination process number.
<i>buf</i>	the send buffer.
<i>l</i>	the size of data in the send buffer in bytes.
<i>tag</i>	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line 463 of file [mpi.c](#).

Referenced by [PF_MUnlock\(\)](#), and [PF_SendFile\(\)](#).

4.81.3.11 PF_RawRecv()

```

LONG PF_RawRecv (
    int * src,
    void * buf,
    LONG thesize,
    int * tag )

```

Receives not more than *thesize* bytes from *src*, returns the actual number of received bytes, or -1 on failure.

Parameters

in, out	<i>src</i>	the source process number. In output, that of the actual received message.
out	<i>buf</i>	the receive buffer.
	<i>thesize</i>	the size of the receive buffer in bytes.
out	<i>tag</i>	the message tag of the actual received message.

Returns

the actual sizeof received data in bytes, or -1 on failure.

Definition at line [484](#) of file [mpi.c](#).

Referenced by [PF_RecvFile\(\)](#).

4.81.3.12 PF_RawProbe()

```

int PF_RawProbe (
    int * src,
    int * tag,
    int * bytesize )

```

Probes an incoming message.

Parameters

in, out	<i>src</i>	the source process number. In output, that of the actual received message.
in, out	<i>tag</i>	the message tag. In output, that of the actual received message.
out	<i>bytesize</i>	the size of incoming data in bytes.

Returns

0 if OK, nonzero on error.

Definition at line [508](#) of file [mpi.c](#).

4.81.3.13 PF_PrintPackBuf()

```

int PF_PrintPackBuf (
    char * s,
    int size )

```

Prints the contents in the pack buffer.

Parameters

<i>s</i>	a message to be shown.
<i>size</i>	the length of the buffer to be shown.

Returns

0 if OK, nonzero on error.

Definition at line 594 of file [mpi.c](#).

4.81.3.14 PF_PrepPack()

```
int PF_PrepPack (  
    void )
```

Prepares for the next pack operations on the sender.

Returns

0 if OK, nonzero on error.

Definition at line 624 of file [mpi.c](#).

Referenced by [Optimize\(\)](#), [PF_BroadcastPreDollar\(\)](#), [PF_BroadcastString\(\)](#), and [PF_Init\(\)](#).

4.81.3.15 PF_Pack()

```
int PF_Pack (  
    const void * buffer,  
    size_t count,  
    MPI_Datatype type )
```

Adds data into the pack buffer.

Parameters

<i>buffer</i>	the pointer to the buffer storing the data to be packed.
<i>count</i>	the number of elements in the buffer.
<i>type</i>	the data type of elements in the buffer.

Returns

0 if OK, nonzero on error.

Definition at line 642 of file [mpi.c](#).

References [MPI_ERRCODE_CHECK](#).

Referenced by [Optimize\(\)](#), [PF_BroadcastPreDollar\(\)](#), and [PF_Init\(\)](#).

4.81.3.16 PF_Unpack()

```
int PF_Unpack (
    void * buffer,
    size_t count,
    MPI_Datatype type )
```

Retrieves the next data in the pack buffer.

Parameters

out	<i>buffer</i>	the pointer to the buffer to store the unpacked data.
	<i>count</i>	the number of elements of data to be received.
	<i>type</i>	the data type of elements of data to be received.

Returns

0 if OK, nonzero on error.

Definition at line 671 of file [mpi.c](#).

References [MPI_ERRCODE_CHECK](#).

Referenced by [Optimize\(\)](#), [PF_BroadcastPreDollar\(\)](#), and [PF_Init\(\)](#).

4.81.3.17 PF_PackString()

```
int PF_PackString (
    const UBYTE * str )
```

Packs a string *str* into the packed buffer `PF_packbuf`, including the trailing zero.

The first element (`PF_INT`) is the length of the packed portion of the string. If the string does not fit to the buffer `PF_packbuf`, the function packs only the initial portion. It returns the number of packed bytes, so if `(str[length-1]!='\0')` then the whole string fits to the buffer, if not, then the rest (`str+length`) must be packed and send again. On error, the function returns the negative error code.

One exception: the string `"\0\0"` is used as an image of the NULL, so all 3 characters will be packed.

Parameters

<i>str</i>	a string to be packed.
------------	------------------------

Returns

the number of packed bytes, or a negative value on failure.

Definition at line 706 of file [mpi.c](#).

Referenced by [PF_BroadcastString\(\)](#).

4.81.3.18 PF_UnpackString()

```
int PF_UnpackString (
    UBYTE * str )
```

Unpacks a string to *str* from the packed buffer PF_packbuf, including the trailing zero.

It returns the number of unpacked bytes, so if (str[length-1]=='\0') then the whole string was unpacked, if not, then the rest must be appended to (str+length). On error, the function returns the negative error code.

Parameters

out	<i>str</i>	the buffer to store the unpacked string
-----	------------	---

Returns

the number of unpacked bytes, or a negative value on failure.

Definition at line 774 of file [mpi.c](#).

Referenced by [PF_BroadcastString\(\)](#).

4.81.3.19 PF_Send()

```
int PF_Send (
    int to,
    int tag )
```

Sends the contents in the pack buffer to the process specified by *to*.

Example:

```
if ( PF.me == SRC ) {
    PF_PreparePack();
    // Packing operations here...
    PF_Send(DEST, TAG);
}
else if ( PF.me == DEST ) {
    PF_Receive(SRC, TAG, &actual_src, &actual_tag);
    // Unpacking operations here...
}
```

Parameters

<i>to</i>	the destination process number.
<i>tag</i>	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line 822 of file [mpi.c](#).

References [MPI_ERRCODE_CHECK](#).

4.81.3.20 PF_Receive()

```
int PF_Receive (
    int src,
    int tag,
    int * psrc,
    int * ptag )
```

Receives data into the pack buffer from the process specified by *src*. This function allows &*src* == *psrc* or &*tag* == *ptag*. Either *psrc* or *ptag* can be NULL.

See the example of [PF_Send\(\)](#).

Parameters

	<i>src</i>	the source process number (can be PF_ANY_SOURCE).
	<i>tag</i>	the source message tag (can be PF_ANY_TAG).
out	<i>psrc</i>	the actual source process number of received message.
out	<i>ptag</i>	the received message tag.

Returns

0 if OK, nonzero on error.

Definition at line 848 of file [mpi.c](#).

References [MPI_ERRCODE_CHECK](#).

4.81.3.21 PF_Broadcast()

```
int PF_Broadcast (
    void )
```

Broadcasts the contents in the pack buffer on the master to those on the slaves.

Example:

```
if ( PF.me == MASTER ) {
    PF_PrepPack();
    // Packing operations here...
}
PF_Broadcast();
if ( PF.me != MASTER ) {
    // Unpacking operations here...
}
```

Returns

0 if OK, nonzero on error.

Definition at line 883 of file [mpi.c](#).

References [MPI_ERRCODE_CHECK](#).

Referenced by [Optimize\(\)](#), [PF_BroadcastPreDollar\(\)](#), [PF_BroadcastString\(\)](#), and [PF_Init\(\)](#).

4.81.3.22 PF_PrepareLongSinglePack()

```
int PF_PrepareLongSinglePack (
    void )
```

Prepares for the next long-single-pack operations on the sender.

Returns

0 if OK, nonzero on error.

Definition at line 1451 of file [mpi.c](#).

Referenced by [PF_CollectModifiedDollars\(\)](#), and [PF_Processor\(\)](#).

4.81.3.23 PF_LongSinglePack()

```
int PF_LongSinglePack (
    const void * buffer,
    size_t count,
    MPI_Datatype type )
```

Adds data into the "long single" pack buffer.

Parameters

<i>buffer</i>	the pointer to the buffer storing the data to be packed.
<i>count</i>	the number of elements in the buffer.
<i>type</i>	the data type of elements in the buffer.

Returns

0 if OK, nonzero on error.

Definition at line 1469 of file [mpi.c](#).

Referenced by [PF_CollectModifiedDollars\(\)](#), and [PF_Processor\(\)](#).

4.81.3.24 PF_LongSingleUnpack()

```
int PF_LongSingleUnpack (
    void * buffer,
    size_t count,
    MPI_Datatype type )
```

Retrieves the next data in the "long single" pack buffer.

Parameters

out	<i>buffer</i>	the pointer to the buffer to store the unpacked data.
	<i>count</i>	the number of elements of data to be received.
	<i>type</i>	the data type of elements of data to be received.

Returns

0 if OK, nonzero on error.

Definition at line 1503 of file [mpi.c](#).

Referenced by [PF_CollectModifiedDollars\(\)](#), and [PF_Processor\(\)](#).

4.81.3.25 PF_LongSingleSend()

```
int PF_LongSingleSend (
    int to,
    int tag )
```

Sends the contents in the "long single" pack buffer to the process specified by *to*.

Example:

```
if ( PF.me == SRC ) {
    PF_PrepareLongSinglePack();
    // Packing operations here...
    PF_LongSingleSend(DEST, TAG);
}
else if ( PF.me == DEST ) {
    PF_LongSingleReceive(SRC, TAG, &actual_src, &actual_tag);
    // Unpacking operations here...
}
```

Parameters

<i>to</i>	the destination process number.
<i>tag</i>	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line 1540 of file [mpi.c](#).

Referenced by [PF_CollectModifiedDollars\(\)](#), and [PF_Processor\(\)](#).

4.81.3.26 PF_LongSingleReceive()

```
int PF_LongSingleReceive (
    int src,
    int tag,
    int * psrc,
    int * ptag )
```

Receives data into the "long single" pack buffer from the process specified by *src*. This function allows *&src == psrc* or *&tag == ptag*. Either *psrc* or *ptag* can be NULL.

See the example of [PF_LongSingleSend\(\)](#).

Parameters

	<i>src</i>	the source process number (can be PF_ANY_SOURCE).
	<i>tag</i>	the source message tag (can be PF_ANY_TAG).
out	<i>psrc</i>	the actual source process number of received message.
out	<i>ptag</i>	the received message tag.

Returns

0 if OK, nonzero on error.

Definition at line 1583 of file [mpi.c](#).

Referenced by [PF_CollectModifiedDollars\(\)](#), and [PF_Processor\(\)](#).

4.81.3.27 PF_PrepareLongMultiPack()

```
int PF_PrepareLongMultiPack (
    void )
```

Prepares for the next long-multi-pack operations on the sender.

Returns

0 if OK, nonzero on error.

Definition at line 1643 of file [mpi.c](#).

Referenced by [Optimize\(\)](#), [PF_BroadcastCBuf\(\)](#), [PF_BroadcastExpFlags\(\)](#), [PF_BroadcastModifiedDollars\(\)](#), and [PF_BroadcastRedefinedPreVars\(\)](#).

4.81.3.28 PF_LongMultiPackImpl()

```
int PF_LongMultiPackImpl (
    const void * buffer,
    size_t count,
    size_t eSize,
    MPI_Datatype type )
```

Adds data into the "long multi" pack buffer.

Parameters

<i>buffer</i>	the pointer to the buffer storing the data to be packed.
<i>count</i>	the number of elements in the buffer.
<i>eSize</i>	the byte size of each element of data.
<i>type</i>	the data type of elements in the buffer.

Returns

0 if OK, nonzero on error.

Definition at line 1662 of file [mpi.c](#).

References [PF_LongMultiPackImpl\(\)](#).

**4.81.3.29 PF_LongMultiUnpackImpl()**

```
int PF_LongMultiUnpackImpl (
    void * buffer,
    size_t count,
    size_t eSize,
    MPI_Datatype type )
```

Retrieves the next data in the "long multi" pack buffer.

Parameters

out	<i>buffer</i>	the pointer to the buffer to store the unpacked data.
	<i>count</i>	the number of elements of data to be received.
	<i>eSize</i>	the byte size of each element of data.
	<i>type</i>	the data type of elements of data to be received.

Returns

0 if OK, nonzero on error.

Definition at line 1721 of file [mpi.c](#).

Here is the call graph for this function:

4.81.3.30 PF_LongMultiBroadcast()

```
int PF_LongMultiBroadcast (
    void )
```

Broadcasts the contents in the "long multi" pack buffer on the master to those on the slaves.

Example:

```
if ( PF.me == MASTER ) {
    PF_PrepareLongMultiPack();
    // Packing operations here...
}
PF_LongMultiBroadcast();
if ( PF.me != MASTER ) {
    // Unpacking operations here...
}
```

Returns

0 if OK, nonzero on error.

00911     #] PF_Broadcast :
00912     #] The pack buffer :
00913     #[ Long pack stuff :
00914     #[ Explanations :
00915
00916     The problems here are:
00917     1. We need to send/receive long dollar variables. For
00918     preprocessor-defined dollarvars we used multiply
00919     packing/broadcasting (see parallel.c:PF_BroadcastPreDollar())
00920     since each variable must be broadcast immediately. For run-time
00921     the changed dollar variables, collecting and broadcasting are
00922     performed at the end of the module and all modified dollarvars
00923     are transferred "at once", that is why the size of packed and
00924     transferred buffers may be really very large.
00925     2. There is some strange feature of MPI_Bcast() on Altix MPI
00926     implementation, namely, sometimes it silently fails with big
00927     buffers. For better performance, it would be useful to send one
00928     big buffer instead of several small ones (since the latency is more
00929     important than the bandwidth). That is why we need two different
00930     sets of routines: for long point-to-point communication we collect
00931     big re-allocatable buffer, the corresponding routines have the
00932     prefix PF_longSingle, and for broadcasting we pack data into
00933     several smaller buffers, the corresponding routines have the
00934     prefix PF_longMulti.
00935     Note, from portability reasons we cannot split large packed

```

```

00936     buffer into small chunks, send them and collect back on the other
00937     side, see "Advice to users" on page 180 MPI--The Complete Reference
00938     Volume1, second edition.
00939     OPTIMIZING:
00940     We assume, for most communications, the single buffer of size
00941     PF_packsize is enough.
00942
00943     How does it work:
00944     For point-to-point, there is one big re-allocatable
00945     buffer PF_longPackBuf with two integer positions: PF_longPackPos
00946     and PF_longPackTop (due to re-allocatable character of the buffer,
00947     it is better to use integers rather than pointers).
00948     Each time of re-allocation, the size of the buffer
00949     PF_longPackBuf is incremented by the same size of a "standard" chunk
00950     PF_packsize.
00951     For broadcasting there is one linked list (PF_longMultiRoot),
00952     which contains either positions of a chunk of PF_longPackBuf, or
00953     it's own buffer. This is done for better memory utilisation:
00954     longSingle and longMulti are never used simultaneously.
00955     When a new cell is needed for longMulti packing, we increment
00956     the counter PF_longPackN and just follow the list. If it is not
00957     possible, we allocate the cell's own buffer and link it to the end
00958     of the list PF_longMultiRoot.
00959     When PF_longPackPos is reallocated, we link new chunks into
00960     existing PF_longMultiRoot list before the first longMulti allocated
00961     cell's own buffer. The pointer PF_longMultiLastChunk points to the last
00962     cell of PF_longMultiRoot containing the pointer to the chunk of
00963     PF_longPackBuf.
00964     Initialization PF_longPackBuf is made by the function
00965     PF_longSingleReset(). In the begin of the PF_longPackBuf it packs
00966     the size of the last sent buffer. Upon sending, the program checks,
00967     whether there was at list one re-allocation (PF_longPackN>1) .
00968     If so, the sender first packs and sends small buffer
00969     (PF_longPackSmallBuf) containing one integer number -- the
00970     _negative_ new size of the send buffer. Getting the buffer, a
00971     receiver unpacks one integer and checks whether it is <0 . If so,
00972     the receiver will repeat receiving, but first it checks whether
00973     it has enough buffer and increase it, if necessary.
00974     Initialization PF_longMultiRoot is made by the function
00975     PF_longMultiReset(). In the begin of the first chunk it packs
00976     one integer -- the number 1. Upon sending, the program checks,
00977     how many cells were packed (PF_longPackN). If more than 1, the
00978     sender packs to the next cell the integer PF_longPackN, than
00979     packs PF_longPackN pairs of integers -- the information about how many
00980     times chunk on each cell was accessed by the packing procedure,
00981     this information is contained by the nPacks field of the cell
00982     structure, and how many non-complete items was at the end of this
00983     chunk the structure field lastLen. Then the sender sends first
00984     this auxiliary chunk.
00985     The receiver unpacks the integer from obtained chunk and, if this
00986     integer is more than 1, it gets more chunks, unpacking information
00987     from the first auxiliary chunk into the corresponding nPacks
00988     fields. Unpacking information from multiple chunks, the receiver
00989     knows, when the chunk is expired and it must switch to the next cell,
00990     successively decrementing corresponding nPacks field.
00991
00992     XXX: There are still some flaws:
00993     PF_LongSingleSend/PF_LongSingleReceive may fail, for example, for data
00994     transfers from the master to many slaves. Suppose that the master sends big
00995     data to slaves, which needs an increase of the buffer of the receivers. For
00996     the first data transfer, the master sends the new buffer size as the first
00997     message, and then sends the data as the second message, because
00998     PF_LongSinglePack records the increase of the buffer size on the master. For
00999     the next time, however, the master sends the data without sending the new
01000     buffer size, and then MPI_Recv fails due to the data overflow.
01001     In parallel.c, they are used for the communication from slaves to the
01002     master. In this case, this problem does not occur because the master always
01003     has enough buffer.
01004     The maximum size that PF_LongMultiBroadcast can broadcast is limited to
01005     around 320kB because the current implementation tries to pack all
01006     information of chained buffers into one buffer, whose size is PF_packsize
01007     = 1600B.

4.87.1 Detailed Description

The complete names administration. All variables with a name have to pass here to be properly registered, have structs of the proper type assigned to them etc. The file also contains the utility routines for maintaining the balanced trees that make searching for names rather fast.

Definition in file [names.c](#).

4.87.2 Function Documentation

4.87.2.1 GetNode()

```
NAMENODE * GetNode (
    NAMETREE * nametree,
    UBYTE * name )
```

Definition at line 49 of file [names.c](#).

4.87.2.2 AddName()

```
int AddName (
    NAMETREE * nametree,
    UBYTE * name,
    WORD type,
    WORD number,
    int * nodenum )

01632
01633 /*
01634 #] CoFunction + ...:
01635 #[ DoTable :
01636
01637     Syntax:
01638     Table [check] [strict|relax] [zerofill] name(:1:2,...,regular arguments);
01639     name must be the name of a regular function.
01640     the table indices must be the first arguments.
01641     The parenthesis indicates 'name' as opposed to the options.
01642
01643     We leave behind:
01644     a struct tabl in the FUNCTION struct
01645     Regular table:
01646         an array tablepointers for the pointers to elements of rhs
01647         in the compiler struct cbuf[T->bufnum]
01648         an array MINMAX T->mm with the minima and maxima
01649         a prototype array
01650         an offset in the compiler buffer for the pattern to be matched
01651     Sparse table:
01652         Just the number of dimensions
01653         We will keep track of the number of defined elements in totind
01654         and in tablepointers we will have numind+1 positions for each
01655         element. The first numind elements for the indices and the
01656         last one for the element in cbuf[T->bufnum].rhs
01657
01658         If the number of dimensions is *<number>, there is not a fixed
01659         number of dimensions. Just a maximum. In that case the first
01660         index should be the number of other dimensions. This first index
01661         does not count in <number>.
01662
01663     Complication: to preserve speed we need a prototype and a pattern
01664     for each thread when we use WITHPTHREADS. This is because we write
01665     into those when looking for the pattern.

4.89.1 Detailed Description

Mainly the routine Normalize. This routine brings terms to standard FORM. Currently it has one serious drawback. Its buffers are all in the stack. This means these buffers have a fixed size (NORMSIZE). In the past this has caused problems and NORMSIZE had to be increased.

It is not clear whether Normalize can be called recursively.

Definition at line [5134](#) of file [normal.c](#).

4.89.3.13 SymbolNormalize()

```
int SymbolNormalize (
    WORD * term )
```

Routine normalizes terms that contain only symbols. Regular minimum and maximum properties are ignored.

We check whether there are negative powers in the output. This is not allowed.
