### 4.120.1 Detailed Description

Mixed routines: Routines for relabelling dummy indices. The multiply command The distrib\_ function The tryreplace statement

Definition in file [reshuf.c](#).

### 4.120.2 Macro Definition Documentation

#### 4.120.2.1 NEWCODE

```
#define NEWCODE
```

Definition at line 35 of file [reshuf.c](#).

### 4.120.3 Function Documentation

#### 4.120.3.1 ReNumber()

```
WORD ReNumber (
    PHEAD WORD * term )
```

Definition at line 80 of file [reshuf.c](#).

#### 4.120.3.2 FunLevel()

```
void FunLevel (
    PHEAD WORD * term )
```

Definition at line 130 of file [reshuf.c](#).

#### 4.120.3.3 DetCurDum()

```
WORD DetCurDum (
    PHEAD WORD * t )
```

Definition at line 252 of file [reshuf.c](#).

#### 4.120.3.4 FullRenumber()

```
int FullRenumber (
    PHEAD WORD * term,
    WORD par )
```

Definition at line [324](#) of file [reshuf.c](#).

#### 4.120.3.5 MoveDummies()

```
void MoveDummies (
    PHEAD WORD * term,
    WORD shift )
```

Definition at line [436](#) of file [reshuf.c](#).

#### 4.120.3.6 AdjustRenumScratch()

```
void AdjustRenumScratch (
    PHEAD0 )
```

Definition at line [506](#) of file [reshuf.c](#).

#### 4.120.3.7 CountDo()

```
WORD CountDo (
    WORD * term,
    WORD * instruct )
```

Definition at line [552](#) of file [reshuf.c](#).

#### 4.120.3.8 CountFun()

```
WORD CountFun (
    WORD * term,
    WORD * countfun )
```

Definition at line [706](#) of file [reshuf.c](#).

#### 4.120.3.9 DimensionSubterm()

```
WORD DimensionSubterm (
    WORD * subterm )
```

Definition at line [867](#) of file [reshuf.c](#).

#### 4.120.3.10 DimensionTerm()

```
WORD DimensionTerm (  
    WORD * term )
```

Definition at line 968 of file [reshuf.c](#).

#### 4.120.3.11 DimensionExpression()

```
WORD DimensionExpression (  
    PHEAD WORD * expr )
```

Definition at line 1000 of file [reshuf.c](#).

#### 4.120.3.12 MultDo()

```
WORD MultDo (  
    PHEAD WORD * term,  
    WORD * pattern )
```

Definition at line 1044 of file [reshuf.c](#).

#### 4.120.3.13 TryDo()

```
WORD TryDo (  
    PHEAD WORD * term,  
    WORD * pattern,  
    WORD level )
```

Definition at line 1072 of file [reshuf.c](#).

#### 4.120.3.14 DoDistrib()

```
WORD DoDistrib (  
    PHEAD WORD * term,  
    WORD level )
```

Definition at line 1119 of file [reshuf.c](#).

#### 4.120.3.15 EqualArg()

```
WORD EqualArg (  
    WORD * parms,  
    WORD num1,  
    WORD num2 )
```

Definition at line 1379 of file [reshuf.c](#).

#### 4.120.3.16 DoDelta3()

```
WORD DoDelta3 (
    PHEAD WORD * term,
    WORD level )
```

Definition at line 1405 of file [reshuf.c](#).

#### 4.120.3.17 TestPartitions()

```
WORD TestPartitions (
    WORD * tfun,
    PARTI * parti )
```

Definition at line 1607 of file [reshuf.c](#).

#### 4.120.3.18 DoPartitions()

```
WORD DoPartitions (
    PHEAD WORD * term,
    WORD level )
```

Definition at line 1722 of file [reshuf.c](#).

#### 4.120.3.19 DoPermutations()

```
WORD DoPermutations (
    PHEAD WORD * term,
    WORD level )
```

Definition at line 2007 of file [reshuf.c](#).

#### 4.120.3.20 DoShuffle()

```
WORD DoShuffle (
    WORD * term,
    WORD level,
    WORD fun,
    WORD option )
```

Definition at line 2095 of file [reshuf.c](#).

#### 4.120.3.21 Shuffle()

```
int Shuffle (
    WORD * from1,
    WORD * from2,
    WORD * to )
```

Definition at line 2229 of file [reshuf.c](#).

#### 4.120.3.22 FinishShuffle()

```
int FinishShuffle (
    WORD * fini )
```

Definition at line [2421](#) of file [reshuf.c](#).

#### 4.120.3.23 DoStuffle()

```
WORD DoStuffle (
    WORD * term,
    WORD * level,
    WORD * fun,
    WORD * option )
```

Definition at line [2487](#) of file [reshuf.c](#).

#### 4.120.3.24 Stuffle()

```
int Stuffle (
    WORD * from1,
    WORD * from2,
    WORD * to )
```

Definition at line [2702](#) of file [reshuf.c](#).

#### 4.120.3.25 FinishStuffle()

```
int FinishStuffle (
    WORD * fini )
```

Definition at line [2829](#) of file [reshuf.c](#).

#### 4.120.3.26 StuffRootAdd()

```
WORD * StuffRootAdd (
    WORD * t1,
    WORD * t2,
    WORD * to )
```

Definition at line [2876](#) of file [reshuf.c](#).

00042 /*
00043   #[ Includes :
00044   #[ Reshuf :
00045
00046   Routines to rearrange dummy indices, so that
00047   a: The notation becomes reasonably unique (the perfect job
00048       may consume very much time).
00049   b: The value of AR.CurDum is reset.
00050
00051   Also some routines are needed to aid in the reading of stored
00052   expressions. Also in those expressions there can be dummy
00053   indices, and there should be no conflict with the already
00054   existing dummies.
00055
00056   #[ ReNumber :
00057
00058   Reads the term, tests for dummies, and puts them in order.
00059   Note that this is kind of a first order approximation.
00060   There is quite some room to make this routine 'smart'
00061   First order:
00062       First index will be lowest, second will be next etc.
00063   Second order:
00064       Functions with more than one index and symmetry properties
00065       have some look ahead to see which index is the first to
00066       find its partner.
00067   Third order:
00068       Take the ordering of the functions into account.
00069   Fourth order:
00070       Try all permutations and see which one gives the 'minimal' term.
00071   Currently we use only the first order.
00072
00073   We need a scratch array for the numbers we find, and one for
00074   the addresses at which these numbers are.
00075   We can use the space for the Scrat arrays. There are 13 of those
00076   and each is AM.MaxTal UWORDS long.
00077
00078 */

01171  /*
01172  t points at the distrib_ function to be expanded.
01173  fun1,fun2 and typ1,typ2 are the two functions and their types.
01174  ntype indicates the action:
01175      0: Make all possible divisions: 2^nargs
01176      1: fun1 should get n arguments: nargs! / ( n! (nargs-n)! )
01177      2: fun2 should get n arguments: nargs! / ( n! (nargs-n)! )
01178  The distinction between 1 and two is for noncommuting objects.
01179      3: fun1 should get n arguments. Super symmetric option.
01180      4: fun2 idem
01181  The super symmetric option involves:
01182      a: arguments get sorted
01183      b: identical arguments are seen as such. Hence not all their
01184         distributions are taken into account. It is as if after the
01185         distrib there is a symmetrize fun1; symmetrize fun2;
01186      c: Hence if the occurrence of each argument is a,b,c,...
01187         and their occurrence in fun1 is a1,b1,c1,... and in fun2
01188         is a2,b2,c2,... then each term is generated (a1+a2)!/a1!/a2!
01189         (b1+b2)!/b1!/b2! (c1+c2)!/c1!/c2! ... times.
01190      d: We have to make an array of occurrences and positions.
01191      e: Then we sort the arguments indirectly.
01192      f: Next we generate the argument lists in the same way as we
01193         generate powers of expressions with binomials. Hence we need
01194         a third array to keep track of the 'powers'

01588     #[ TestPartitions :
01589
01590     Checks whether the function in tfun is a partitions_ function
01591     that can be expanded. If it can a number of relevant objects is
01592     inside the struct parti.
01593     This test is not entirely trivial because there are many restrictions
01594     w.r.t. the arguments.
01595     Syntax (still to be implemented)
01596     partitions_(number_of_partition_entries, [function, number,]^nope, arguments)
01597     [function, number,]: can be
01598         f,3      for a partition of 3 arguments
01599         f,0      for the remaining arguments (should be last)
01600         num1,f,num2 with num1 effectively a number of partitions but this
01601         counts as num1 entries.
01602         0,f,num2: all partitions have num2 arguments. No number of partition
01603         entries needed. If num2 does not divide the number of
01604         arguments there will be no action.

01785     Now comes the part where we have to make sure that
01786     a: we generate all partitions.
01787     b: we generate only different partitions.
01788     c: we get the proper combinatorics factor.
01789     Method:
01790     Suppose the largest partition needs n objects and there are m partitions.
01791     We allocate m arrays of n 'digits'. Make in the smaller partitions the
01792     appropriate leading digits zero.
01793     Divide the largest numbers (of the arguments) over the partitions as
01794     leftmost digits (after possible zeroes). The arrays, seen as numbers,
01795     should be such that each is less or equal to its left neighbour. Take the
01796     next largest numbers, etc. This generates unique partitions and all of
01797     them. Because we have a formula for the multiplicity, this should do it.
01798
01799     The general case. At a later stage we might put in a more economical
01800     version for special cases.

02195 #] DoShuffle :
02196 #[ Shuffle :
02197
02198 How to make shuffles:
02199
02200 We have two lists of arguments. We have to make a single
02201 shuffle of them. All combinations. Doubles should have as
02202 much as possible a combinatorics factor. Sometimes this is
02203 very difficult as in:
02204     (0,1,2)x(0,1,3) = -> (0,1) is a repeated pattern and the
02205     factor on that is difficult
02206 Simple way: (without combinatorics)
02207     repeat id f0(?c)*f(x1?,?a)*f(x2?,?b) =
02208             +f0(?c,x1)*f(?a)*f(x2,?b)
02209             +f0(?c,x2)*f(x1,?a)*f(?b);
02210
02211 Refinement:
02212     if ( x1 == x2 ) check how many more there are of the same.
02213     --> (n1,x) and (n2,x)
02214     id f0(?c)*f1((n1,x),?b)*f2((n2,x),?c) =
02215             +binom_(n1+n2,n1)*f0(?c,(n1+n2,x))*f1(?a)*f2(?b)
02216             +sum_(j,0,n1-1,binom_(n2+j,j)*f0(?c,(j+n2,x))
02217             *f1((n1-j),?a)*f2(?b))*force2
02218             +sum_(j,0,n2-1,binom_(n1+j,j)*f0(?c,(j+n1,x))
02219             *f1(?a)*f2((n2-j),?b))*force1
02220
02221 The force operation can be executed directly
02222
02223 The next question is how to program this: recursively or linearly
02224 which would require simulation of a recursion. Recursive is clearest
02225 but we need to pass a number of arguments from the calling routine
02226 to the final routine. This is done with AN.SHvar.
02227
02228 We need space for the accumulation of the combinatoric factors.

02411 The complications here are:
02412 1: We want to save space. We put the output term in 'out' straight
02413    on top of what we produced thusfar. We have to copy the early
02414    piece because once the term goes back to Generator, Normalize can
02415    change it in situ
02416 2: There can be other occurrence of the function between the two
02417    that we did. For shuffles that isn't likely, but we use this
02418    routine also for the stuffles and there it can happen.

02471
02472     Stuffling is a variation of shuffling.
02473     In the stuffinging we insist that the arguments are (short) integers. nonzero.
02474     The stuffle sum is x st y = sig_(x)*sig_(y)*(abs(x)+abs(y))
02475     The way we do this is:
02476         1: count the arguments in each function: n1, n2
02477         2: take the minimum minval = min(n1,n2).
02478         3: for ( j = 0; j <= min; j++ ) take j elements in each of the lists.
02479         4: the j+1 groups of remaining arguments have to each be shuffled
02480         5: the j selected pairs have to be stuffle added.
02481     We can use many of the shuffle things.
02482     Considering the recursive nature of the generation we actually don't
02483     need to know n1, n2, minval.

02857
02858     Makes the stuffle sum of two arguments.
02859     The arguments can be of one of three types:
02860     1: -SNUMBER,num
02861     2: -SYMBOL,symbol
02862     3: Numerical (long) argument.
02863     4: Generic argument with (only) symbols that are roots of unity and
02864        a coefficient.
02865     We have excluded the case that both t1 and t2 are of type 1:
02866     The output should be written to 'to' and the new fill position should
02867     be the return value.
02868     'to' is inside the workspace.
02869
02870     The stuffle sum is sig_(t2)*t1+sig_(t1)*t2
02871     or sig_(t1)*sig_(t2)*(abs_(t1)+abs_(t2))

### 4.122.1 Detailed Description

Contains the functions that deal with the writing of expressions/terms in a textual representation. (Dutch schrijven = to write)

Definition in file [sch.c](#).

### 4.122.2 Macro Definition Documentation

#### 4.122.2.1 `va_dcl`

```
#define va_dcl int va_alist;
```

Definition at line 48 of file [sch.c](#).

#### 4.122.2.2 `va_start`

```
#define va_start(  
    list ) list = (UBYTE *) &va_alist
```

Definition at line 49 of file [sch.c](#).

#### 4.122.2.3 `va_end`

```
#define va_end(  
    list )
```

Definition at line 50 of file [sch.c](#).

#### 4.122.2.4 `va_arg`

```
#define va_arg(  
    list,  
    mode ) (((mode *) (list += sizeof(mode)))[-1])
```

Definition at line 51 of file [sch.c](#).

### 4.122.3 Typedef Documentation

#### 4.122.3.1 `va_list`

```
typedef UBYTE* va_list
```

Definition at line 47 of file [sch.c](#).

## 4.122.4 Function Documentation

### 4.122.4.1 StrCopy()

```
UBYTE * StrCopy (
    UBYTE * from,
    UBYTE * to )
```

Definition at line 67 of file [sch.c](#).

### 4.122.4.2 AddToLine()

```
void AddToLine (
    UBYTE * s )
```

Definition at line 82 of file [sch.c](#).

### 4.122.4.3 FiniLine()

```
void FiniLine (
    void )
```

Definition at line 182 of file [sch.c](#).

### 4.122.4.4 IniLine()

```
void IniLine (
    WORD extrablank )
```

Definition at line 267 of file [sch.c](#).

### 4.122.4.5 LongToLine()

```
void LongToLine (
    UWORD * a,
    WORD na )
```

Definition at line 303 of file [sch.c](#).

### 4.122.4.6 RatToLine()

```
void RatToLine (
    UWORD * a,
    WORD na )
```

Definition at line 337 of file [sch.c](#).

#### 4.122.4.7 TalToLine()

```
void TalToLine (
    UWORD x )
```

Definition at line [522](#) of file [sch.c](#).

#### 4.122.4.8 TokenToLine()

```
void TokenToLine (
    UBYTE * s )
```

Definition at line [551](#) of file [sch.c](#).

#### 4.122.4.9 CodeToLine()

```
UBYTE * CodeToLine (
    WORD number,
    UBYTE * Out )
```

Definition at line [658](#) of file [sch.c](#).

#### 4.122.4.10 MultiplyToLine()

```
void MultiplyToLine (
    void )
```

Definition at line [671](#) of file [sch.c](#).

#### 4.122.4.11 AddArrayIndex()

```
UBYTE * AddArrayIndex (
    WORD num,
    UBYTE * out )
```

Definition at line [696](#) of file [sch.c](#).

#### 4.122.4.12 PrtTerms()

```
void PrtTerms (
    void )
```

Definition at line [716](#) of file [sch.c](#).

#### 4.122.4.13 WrtPower()

```
UBYTE * WrtPower (
    UBYTE * Out,
    WORD Power )
```

Definition at line 738 of file [sch.c](#).

#### 4.122.4.14 PrintTime()

```
void PrintTime (
    UBYTE * mess )
```

Definition at line 784 of file [sch.c](#).

#### 4.122.4.15 WriteLists()

```
void WriteLists (
    void )
```

Definition at line 810 of file [sch.c](#).

#### 4.122.4.16 WriteDictionary()

```
void WriteDictionary (
    DICTIONARY * dict )
```

Definition at line 1307 of file [sch.c](#).

#### 4.122.4.17 WriteArgument()

```
void WriteArgument (
    WORD * t )
```

Definition at line 1424 of file [sch.c](#).

#### 4.122.4.18 WriteSubTerm()

```
WORD WriteSubTerm (
    WORD * sterm,
    WORD first )
```

Definition at line 1542 of file [sch.c](#).

#### 4.122.4.19 WriteInnerTerm()

```
WORD WriteInnerTerm (
    WORD * term,
    WORD first )
```

Definition at line [1951](#) of file [sch.c](#).

#### 4.122.4.20 WriteTerm()

```
WORD WriteTerm (
    WORD * term,
    WORD * lbrac,
    WORD first,
    WORD prtf,
    WORD br )
```

Definition at line [2148](#) of file [sch.c](#).

#### 4.122.4.21 WriteExpression()

```
WORD WriteExpression (
    WORD * terms,
    LONG ltot )
```

Definition at line [2470](#) of file [sch.c](#).

#### 4.122.4.22 WriteAll()

```
WORD WriteAll (
    void )
```

Definition at line [2501](#) of file [sch.c](#).

#### 4.122.4.23 WriteOne()

```
WORD WriteOne (
    UBYTE * name,
    int alreadyinline,
    int nosemi,
    WORD plus )
```

Definition at line [2727](#) of file [sch.c](#).

00797
00798     The routine writes the values of the setup parameters.
00799     We should do this better. (JV, 21-may-2008)
00800     The way it should be done is:
00801         a: write the raw values.
00802         b: give readjusted values.
00803         c: give derived values.
00804     Because this is a difficult subject, it would be nice to have a LaTeX
00805     document that explains this all exactly. There should then be a
00806     mechanism to poke the values of the setup into the LaTeX document.
00807     probably the easiest way is to make a file with lots of \def definitions
00808     and have that included into the LaTeX file.

## 4.126 smart.c File Reference

```
#include "form3.h"
```

Include dependency graph for smart.c:

### Functions

- int [StudyPattern](#) (WORD \*lhs)
- int [MatchIsPossible](#) (WORD \*pattern, WORD \*term)

### 4.126.1 Detailed Description

The functions for smart pattern searches in combinations of functions. When many wildcards are involved and the functions are (anti)symmetric an exhaustive search for all possibilities may take very much time (like factorial in the number of wildcards) while a human can often see immediately that there cannot be a match. The routines here try to make FORM a bit smarter in this respect.

This is just the beginning. It still needs lots of work!

Definition in file [smart.c](#).

### 4.126.2 Function Documentation

#### 4.126.2.1 StudyPattern()

```
int StudyPattern (
    WORD * lhs )
```

Definition at line 62 of file [smart.c](#).

#### 4.126.2.2 MatchIsPossible()

```
int MatchIsPossible (
    WORD * pattern,
    WORD * term )
```

Definition at line 299 of file [smart.c](#).

- char \* [totrms](#) [] = { " ", ">>", "-->" }

### 4.128.1 Detailed Description

Contains the sort routines. We distinguish levels of sorting. The ground level is the sorting of terms in an expression. When a term has functions, the arguments can contain terms that need sorting, which this then done by raising the level. This can happen recursively. NewSort and EndSort automatically raise and lower the level. Because the ground level does some special things, sometimes we have to raise immediately to the second level skipping the ground level.

Special routines for the parallel sorting are in the file [threads.c](#) Also the sorting of terms in polynomials is special but most of that is controlled by changing the address of the compare routine. Other routines relevant for adding rational polynomials are in the file [polynito.c](#)

Definition in file [sort.c](#).

### 4.128.2 Macro Definition Documentation

#### 4.128.2.1 NEWSPLITMERGE

```
#define NEWSPLITMERGE
```

Definition at line [53](#) of file [sort.c](#).

#### 4.128.2.2 NEWSPLITMERGETIMSORT

```
#define NEWSPLITMERGETIMSORT
```

Definition at line [55](#) of file [sort.c](#).

#### 4.128.2.3 INSLENGTH

```
#define INSLENGTH(  
    x ) w[1] = FUNHEAD+ARGHEAD+x; w[FUNHEAD] = ARGHEAD+x;
```

Definition at line [2305](#) of file [sort.c](#).

### 4.128.3 Function Documentation

#### 4.128.3.1 WriteStats()

```
void WriteStats (  
    POSITION * plspace,  
    WORD par,  
    WORD checkLogType )
```

Writes the statistics.

## Parameters

|                     |                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>plspace</i>      | The size in bytes currently occupied                                                                                                     |
| <i>par</i>          | par = 0 = STATSSPLITMERGE after a splitmerge. par = 1 = STATSMERGETOFILE after merge to sortfile. par = 2 = STATSPOSTSORT after the sort |
| <i>checkLogType</i> | == CHECKLOGTYPE: The output should not go to the log file if AM.LogType is 1.                                                            |

current expression is to be found in AR.CurExpr. terms are in S->TermsLeft. S->GenTerms.

Definition at line 101 of file [sort.c](#).

References [TimeCPU\(\)](#), and [TimeWallClock\(\)](#).

Referenced by [EndSort\(\)](#), [PF\\_Processor\(\)](#), and [StoreTerm\(\)](#).

Here is the call graph for this function:

#### 4.128.3.2 NewSort()

```
WORD NewSort (
    PHEAD0 )
```

Starts a new sort. At the lowest level this is a 'main sort' with the struct according to the parameters in S0. At higher levels this is a sort for functions, subroutines or dollars. We prepare the arrays and structs.

## Returns

Regular convention (OK -> 0)

Definition at line 614 of file [sort.c](#).

Referenced by [generate\\_expression\(\)](#), [get\\_expression\(\)](#), [InFunction\(\)](#), [MakeDollarInteger\(\)](#), [MakeDollarMod\(\)](#), [PF\\_CollectModifiedDollars\(\)](#), [PF\\_Processor\(\)](#), [poly\\_factorize\\_expression\(\)](#), [poly\\_sort\(\)](#), [poly\\_unfactorize\\_expression\(\)](#), [PolyFunMul\(\)](#), [Processor\(\)](#), [TakeArgContent\(\)](#), and [TestMatch\(\)](#).

### 4.128.3.3 EndSort()

```
LONG EndSort (
    PHEAD WORD * buffer,
    int par )
```

Finishes a sort. At AR.sLevel == 0 the output is to the regular output stream. When AR.sLevel > 0, the parameter par determines the actual output. The AR.sLevel will be popped. All ongoing stages are finished and if the sortfile is open it is closed. The statistics are printed when AR.sLevel == 0 par == 0 [Output](#) to the buffer. par == 1 Sort for function arguments. The output will be copied into the buffer. It is assumed that this is in the Workspace. par == 2 Sort for \$-variable. We return the address of the buffer that contains the output in buffer (treated like WORD \*\*). We first catch the output in a file (unless we can intercept things after the small buffer has been sorted) Then we read from the file into a buffer. Only when par == 0 data compression can be attempted at AT.SS==AT.S0.

## Parameters

|               |                               |
|---------------|-------------------------------|
| <i>buffer</i> | buffer for output when needed |
| <i>par</i>    | See above                     |

## Returns

If negative: error. If positive: number of words in output.

Definition at line 704 of file [sort.c](#).

References [ComPress\(\)](#), [FlushOut\(\)](#), [MergePatches\(\)](#), [PF\\_EndSort\(\)](#), [PutOut\(\)](#), [SplitMerge\(\)](#), [StageSort\(\)](#), and [WriteStats\(\)](#).

Referenced by [generate\\_expression\(\)](#), [get\\_expression\(\)](#), [InFunction\(\)](#), [MakeDollarInteger\(\)](#), [MakeDollarMod\(\)](#), [PF\\_CollectModifiedDollars\(\)](#), [PF\\_Processor\(\)](#), [poly\\_factorize\\_expression\(\)](#), [poly\\_sort\(\)](#), [poly\\_unfactorize\\_expression\(\)](#), [PolyFunMul\(\)](#), [Processor\(\)](#), [TakeArgContent\(\)](#), and [TestMatch\(\)](#).

Here is the call graph for this function:

## 4.128.3.4 PutIn()

```

LONG PutIn (
    FILEHANDLE * file,
    POSITION * position,
    WORD * buffer,
    WORD ** take,
    int npat )

```

Reads a new patch from position in file handle. It is put at buffer, anything after take is moved forward. This would be part of a term that hasn't been used yet. Because of this there should be some space before the start of the buffer

## Parameters

|                 |                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <i>file</i>     | The file system from which to read                                                                                                        |
| <i>position</i> | The position from which to read                                                                                                           |
| <i>buffer</i>   | The buffer into which to read                                                                                                             |
| <i>take</i>     | The unused tail should be moved before the buffer                                                                                         |
| <i>npat</i>     | The number of the patch. Is needed if the information was compressed with gzip, because each patch has its own independent gzip encoding. |

Definition at line 1291 of file [sort.c](#).

References [FiLe::handle](#).

Referenced by [MergePatches\(\)](#).

#### 4.128.3.5 Sflush()

```
WORD Sflush (
    FILEHANDLE * fi )
```

Puts the contents of a buffer to output Only to be used when there is a single patch in the large buffer.

##### Parameters

|           |                                                                    |
|-----------|--------------------------------------------------------------------|
| <i>fi</i> | The filesystem (or its cache) to which the patch should be written |
|-----------|--------------------------------------------------------------------|

Definition at line 1351 of file [sort.c](#).

References [FiLe::handle](#).

Referenced by [MergePatches\(\)](#).

#### 4.128.3.6 PutOut()

```
WORD PutOut (
    PHEAD WORD * term,
    POSITION * position,
    FILEHANDLE * fi,
    WORD ncomp )
```

Routine writes one term to file handle at position. It returns the new value of the position.

NOTE: For 'final output' we may have to index the brackets. See the struct BRACKETINDEX. We should maintain:  
 1: a list with brackets array with the brackets  
 2: a list of objects of type BRACKETINDEX. It contains array with either pointers or offsets to the list of brackets. starting positions in the file. The index may be tied to a maximum size. In that case we may have to prune the list occasionally.

##### Parameters

|                 |                                                           |
|-----------------|-----------------------------------------------------------|
| <i>term</i>     | The term to be written                                    |
| <i>position</i> | The position in the file. Afterwards it is updated        |
| <i>fi</i>       | The file (or its cache) to which should be written        |
| <i>ncomp</i>    | Information about what type of compression should be used |

Definition at line 1437 of file [sort.c](#).

References [FiLe::handle](#), and [PF\\_ISendSbuf\(\)](#).

Referenced by [EndSort\(\)](#), [generate\\_expression\(\)](#), [MergePatches\(\)](#), [PF\\_EndSort\(\)](#), [PF\\_Processor\(\)](#), and [Processor\(\)](#).

Here is the call graph for this function:

#### 4.128.3.7 FlushOut()

```
WORD FlushOut (
    POSITION * position,
    FILEHANDLE * fi,
    int compr )
```

Completes output to an output file and writes the trailing zero.

##### Parameters

|                 |                                                          |
|-----------------|----------------------------------------------------------|
| <i>position</i> | The position in the file after writing                   |
| <i>fi</i>       | The file (or its cache)                                  |
| <i>compr</i>    | Indicates whether there should be compression with gzip. |

##### Returns

Regular conventions (OK -> 0).

Definition at line 1799 of file [sort.c](#).

References [FiLe::handle](#), [BrAcKeTiNfO::indexbuffer](#), and [PF\\_ISendSbuf\(\)](#).

Referenced by [EndSort\(\)](#), [MergePatches\(\)](#), [PF\\_EndSort\(\)](#), and [Processor\(\)](#).

Here is the call graph for this function:

**4.128.3.8 AddCoef()**

```
WORD AddCoef (
    PHEAD WORD ** ps1,
    WORD ** ps2 )
```

Adds the coefficients of the terms \*ps1 and \*ps2. The problem comes when there is not enough space for a new longer coefficient. First a local solution is tried. If this is not successful we need to move terms around. The possibility of a garbage collection should not be ignored, as avoiding this costs very much extra space which is nearly wasted otherwise.

If the return value is zero the terms cancelled.

The resulting term is left in \*ps1.

Definition at line 2013 of file [sort.c](#).

References [GarbHand\(\)](#), and [NormalModulus\(\)](#).

Referenced by [SplitMerge\(\)](#).

Here is the call graph for this function:

**4.128.3.9 AddPoly()**

```
WORD AddPoly (
    PHEAD WORD ** ps1,
    WORD ** ps2 )
```

Routine should be called when `S->PolyWise != 0`. It points then to the position of `AR.PolyFun` in both terms.

We add the contents of the arguments of the two polynomials. Special attention has to be given to special arguments. We have to reserve a space equal to the size of one term + the size of the argument of the other. The addition has to be done in this routine because not all objects are reentrant.

Newer addition (12-nov-2007). The `PolyFun` can have two arguments. In that case `S->PolyFlag` is 2 and we have to call the routine for adding rational polynomials. We have to be rather careful what happens with: The location of the output The order of the terms in the arguments At first we allow only univariate polynomials in the `PolyFun`. This restriction will be lifted a.s.a.p.

## Parameters

|            |                                              |
|------------|----------------------------------------------|
| <i>ps1</i> | A pointer to the position of the first term  |
| <i>ps2</i> | A pointer to the position of the second term |

## Returns

If zero the terms cancel. Otherwise the new term is in \*ps1.

Definition at line 2142 of file [sort.c](#).

References [AddArgs\(\)](#), [GarbHand\(\)](#), and [poly\\_ratfun\\_add\(\)](#).

Referenced by [SplitMerge\(\)](#).

Here is the call graph for this function:

## 4.128.3.10 AddArgs()

```

void AddArgs (
    PHEAD WORD * s1,
    WORD * s2,
    WORD * m )

```

Adds the arguments of two occurrences of the PolyFun.

## Parameters

|           |                                        |
|-----------|----------------------------------------|
| <i>s1</i> | Pointer to the first occurrence.       |
| <i>s2</i> | Pointer to the second occurrence.      |
| <i>m</i>  | Pointer to where the answer should be. |

Definition at line 2314 of file [sort.c](#).

Referenced by [AddPoly\(\)](#), and [MergePatches\(\)](#).

#### 4.128.3.11 Compare1()

```
WORD Compare1 (
    PHEAD WORD * term1,
    WORD * term2,
    WORD level )
```

Compares two terms. The answer is: 0 equal ( with exception of the coefficient if level == 0. ) >0 term1 comes first. <0 term2 comes first. Some special precautions may be needed to keep the CompCoef routine from generating overflows, although this is very unlikely in subterms. This routine should not return an error condition.

Originally this routine was called Compare. With the treatment of special polynomials with terms that contain only symbols and the need for extreme speed for the polynomial routines we made a special compare routine and now we store the address of the current compare routine in AR.CompareRoutine and have a macro Compare which makes all existing code work properly and we can just replace the routine on a thread by thread basis (each thread has its own AR struct).

##### Parameters

|              |                                                 |
|--------------|-------------------------------------------------|
| <i>term1</i> | First input term                                |
| <i>term2</i> | Second input term                               |
| <i>level</i> | The sorting level (may influence on the result) |

##### Returns

0 equal ( with exception of the coefficient if level == 0. ) >0 term1 comes first. <0 term2 comes first.

When there are floating point numbers active (float\_ = FLOATFUN) the presence of one or more float\_ functions is returned in AT.SortFloatMode: 0: no float\_ 1: float\_ in term1 only 2: float\_ in term2 only 3: float\_ in both terms

Definition at line [2607](#) of file [sort.c](#).

References [CompCoef\(\)](#).

Referenced by [InFunction\(\)](#), [poly\\_sort\(\)](#), and [StartVariables\(\)](#).

Here is the call graph for this function:

#### 4.128.3.12 CompareSymbols()

```
WORD CompareSymbols (
    PHEAD WORD * term1,
    WORD * term2,
    WORD par )
```

Compares the terms, based on the value of AN.polysortflag. If  $term1 < term2$  the return value is -1 If  $term1 > term2$  the return value is 1 If  $term1 = term2$  the return value is 0 The coefficients may differ. The terms contain only a single subterm of type SYMBOL. If AN.polysortflag = 0 it is a 'regular' compare. If AN.polysortflag = 1 the sum of the powers is more important par is a dummy parameter to make the parameter field identical to that of Compare1 which is the regular compare routine in [sort.c](#)

Definition at line [3071](#) of file [sort.c](#).

Referenced by [InFunction\(\)](#), and [poly\\_sort\(\)](#).

#### 4.128.3.13 CompareHSymbols()

```
WORD CompareHSymbols (
    PHEAD WORD * term1,
    WORD * term2,
    WORD par )
```

Compares terms that can have only SYMBOL and HAAKJE subterms. If  $term1 < term2$  the return value is -1 If  $term1 > term2$  the return value is 1 If  $term1 = term2$  the return value is 0 par is a dummy parameter to make the parameter field identical to that of Compare1 which is the regular compare routine in [sort.c](#)

Definition at line [3114](#) of file [sort.c](#).

#### 4.128.3.14 ComPress()

```
LONG ComPress (
    WORD ** ss,
    LONG * n )
```

Gets a list of pointers to terms and compresses the terms. In n it collects the number of terms and the return value of the function is the space that is occupied.

We have to pay some special attention to the compression of terms with a PolyFun. This PolyFun should occur only straight before the coefficient, so we can use the same trick as for the coefficient to sabotage compression of this object (Replace in the history the function pointer by zero. This is safe, because terms that would be identical otherwise would have been added).

##### Parameters

|           |                                              |
|-----------|----------------------------------------------|
| <i>ss</i> | Array of pointers to terms to be compressed. |
| <i>n</i>  | Number of pointers in ss.                    |

##### Returns

Total number of words needed for the compressed result.

Definition at line 3167 of file [sort.c](#).

Referenced by [EndSort\(\)](#), and [StoreTerm\(\)](#).

#### 4.128.3.15 SplitMerge()

```
LONG SplitMerge (
    PHEAD WORD ** Pointer,
    LONG number )
```

Algorithm by J.A.M.Vermaseren (31-7-1988)

Note that AN.SplitScratch and AN.InScratch are used also in GarbHand

Merge sort in memory. The input is an array of pointers. Sorting is done recursively by dividing the array in two equal parts and calling SplitMerge for each. When the parts are small enough we can do the compare and take the appropriate action. An addition is that we look for 'runs'. Sequences that are already ordered. This happens a lot when there is very little action in a module. This made FORM faster by a few percent.

##### Parameters

|                |                                                  |
|----------------|--------------------------------------------------|
| <i>Pointer</i> | The array of pointers to the terms to be sorted. |
| <i>number</i>  | The number of pointers in Pointer.               |

The terms are supposed to be sitting in the small buffer and there is supposed to be an extension to this buffer for when there are two terms that should be added and the result takes more space than each of the original terms. The notation guarantees that the result never needs more space than the sum of the spaces of the original terms.

Definition at line 3333 of file [sort.c](#).

References [AddCoef\(\)](#), [AddPoly\(\)](#), and [SplitMerge\(\)](#).

Referenced by [EndSort\(\)](#), [SplitMerge\(\)](#), and [StoreTerm\(\)](#).

Here is the call graph for this function:

**4.128.3.16 GarbHand()**

```
void GarbHand (
    void )
```

Garbage collection that takes place when the small extension is full and we need to place more terms there. When this is the case there are many holes in the small buffer and the whole can be compactified. The major complication is the buffer for SplitMerge. There are two options for temporary memory: 1: find some buffer that has enough space (maybe in the large buffer). 2: allocate a buffer. Give it back afterwards of course. If the small extension is properly dimensioned this routine should be called very rarely. Most of the time it will be called when the polyfun or polyratfun is active.

Definition at line 3613 of file [sort.c](#).

Referenced by [AddCoef\(\)](#), and [AddPoly\(\)](#).

**4.128.3.17 MergePatches()**

```
WORD MergePatches (
    WORD par )
```

The general merge routine. Can be used for the large buffer and the file merging. The array S->Patches tells where the patches start S->pStop tells where they end (has to be computed first). The end of a 'line to be merged' is indicated by a zero. If the end is reached without running into a zero or a term runs over the boundary of a patch it is a file merging operation and a new piece from the file is read in.

**Parameters**

|            |                                                                                                                                                                                    |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>par</i> | If <i>par</i> == 0 the sort is for file -> outputfile. If <i>par</i> == 1 the sort is for large buffer -> sortfile. If <i>par</i> == 2 the sort is for large buffer -> outputfile. |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Definition at line 3728 of file [sort.c](#).

References [AddArgs\(\)](#), [FlushOut\(\)](#), [File::handle](#), [NormalModulus\(\)](#), [poly\\_ratfun\\_add\(\)](#), [PutIn\(\)](#), [PutOut\(\)](#), [Sflush\(\)](#), and [StageSort\(\)](#).

Referenced by [EndSort\(\)](#), and [StoreTerm\(\)](#).

Here is the call graph for this function:

#### 4.128.3.18 StoreTerm()

```
WORD StoreTerm (
    PHEAD WORD * term )
```

The central routine to accept terms, store them and keep things at least partially sorted. A call to `EndSort` will then complete storing and sorting.

##### Parameters

|             |                       |
|-------------|-----------------------|
| <i>term</i> | The term to be stored |
|-------------|-----------------------|

##### Returns

Regular return conventions (OK -> 0)

Definition at line 4511 of file [sort.c](#).

References [ComPress\(\)](#), [MergePatches\(\)](#), [SplitMerge\(\)](#), and [WriteStats\(\)](#).

Referenced by [Generator\(\)](#), [get\\_expression\(\)](#), [InFunction\(\)](#), [PF\\_Processor\(\)](#), [poly\\_sort\(\)](#), [PolyFunMul\(\)](#), [Processor\(\)](#), and [TakeArgContent\(\)](#).

Here is the call graph for this function:

#### 4.128.3.19 StageSort()

```
void StageSort (
    FILEHANDLE * fout )
```

Prepares a stage 4 or higher sort. Stage 4 sorts occur when the sort file contains more patches than can be merged in one pass.

Definition at line 4625 of file [sort.c](#).

References [FiLe::handle](#).

Referenced by [EndSort\(\)](#), and [MergePatches\(\)](#).

#### 4.128.3.20 SortWild()

```
WORD SortWild (
    WORD * w,
    WORD nw )
```

Sorts the wildcard entries in the parameter w. Double entries are removed. Full space taken is nw words. Routine serves for the reading of wildcards in the compiler. The entries come in the format: (type,4,number,0) in which the zero is reserved for the future replacement of 'number'.

##### Parameters

|           |                               |
|-----------|-------------------------------|
| <i>w</i>  | buffer with wildcard entries. |
| <i>nw</i> | number of wildcard entries.   |

## Returns

Normal conventions (OK -> 0)

Definition at line [4724](#) of file [sort.c](#).

### 4.128.3.21 CleanUpSort()

```
void CleanUpSort (
    int num )
```

Partially or completely frees function sort buffers.

Definition at line [4816](#) of file [sort.c](#).

### 4.128.3.22 LowerSortLevel()

```
void LowerSortLevel (
    void )
```

Lowers the level in the sort system.

Definition at line [4916](#) of file [sort.c](#).

Referenced by [generate\\_expression\(\)](#), [get\\_expression\(\)](#), [InFunction\(\)](#), [PF\\_CollectModifiedDollars\(\)](#), [PF\\_Processor\(\)](#), [poly\\_factorize\\_expression\(\)](#), [poly\\_sort\(\)](#), [poly\\_unfactorize\\_expression\(\)](#), [PolyFunMul\(\)](#), [Processor\(\)](#), and [TestMatch\(\)](#).

### 4.128.3.23 PolyRatFunSpecial()

```
WORD * PolyRatFunSpecial (
    PHEAD WORD * t1,
    WORD * t2 )
```

Definition at line [4933](#) of file [sort.c](#).

### 4.128.3.24 SimpleSplitMergeRec()

```
void SimpleSplitMergeRec (
    WORD * array,
    WORD num,
    WORD * auxarray )
```

Definition at line [5035](#) of file [sort.c](#).

### 4.128.3.25 SimpleSplitMerge()

```
void SimpleSplitMerge (
    WORD * array,
    WORD num )
```

Definition at line [5063](#) of file [sort.c](#).

#### 4.128.3.26 BinarySearch()

```
WORD BinarySearch (
    WORD * array,
    WORD num,
    WORD x )
```

Definition at line [5081](#) of file [sort.c](#).

### 4.128.4 Variable Documentation

#### 4.128.4.1 numcompares

```
LONG numcompares
```

Definition at line [75](#) of file [sort.c](#).

#### 4.128.4.2 totterms

```
char* totterms[] = { " ", " >>", "-->" }
```

Definition at line [83](#) of file [sort.c](#).

04633                 There are no proper provisions for stage 4 or higher sorts
04634                 for function arguments and $ variables. The reason:
04635                 The current code maps out the patches, based on the size of
04636                 the buffers in the FoStage4 structs, while they are used
04637                 inside the S->file struct that may have far smaller buffers.
04638                 By itself that might still be repairable, but it goes completely
04639                 wrong when during the sort polyRatFuns have to be added and they
04640                 would go into stage4 (very rare but possible).
04641                 The only really correct solution would be to put FoStage4 structs
04642                 in all sort levels. Messy. (JV 8-oct-2018).

#### 4.130.1 Detailed Description

File contains the code for the spectator files and their control.

Definition in file [spectator.c](#).

#### 4.130.2 Function Documentation

##### 4.130.2.1 CoCreateSpectator()

```
int CoCreateSpectator (  
    UBYTE * inp )
```

Definition at line 89 of file [spectator.c](#).

##### 4.130.2.2 CoToSpectator()

```
int CoToSpectator (  
    UBYTE * inp )
```

Definition at line 181 of file [spectator.c](#).

##### 4.130.2.3 CoRemoveSpectator()

```
int CoRemoveSpectator (  
    UBYTE * inp )
```

Definition at line 233 of file [spectator.c](#).

##### 4.130.2.4 CoEmptySpectator()

```
int CoEmptySpectator (  
    UBYTE * inp )
```

Definition at line 293 of file [spectator.c](#).

#### 4.130.2.5 PutInSpectator()

```
int PutInSpectator (
    WORD * term,
    WORD specnum )
```

Definition at line [345](#) of file [spectator.c](#).

#### 4.130.2.6 FlushSpectators()

```
void FlushSpectators (
    void )
```

Definition at line [402](#) of file [spectator.c](#).

#### 4.130.2.7 CoCopySpectator()

```
int CoCopySpectator (
    UBYTE * inp )
```

Definition at line [459](#) of file [spectator.c](#).

#### 4.130.2.8 GetFromSpectator()

```
WORD GetFromSpectator (
    WORD * term,
    WORD specnum )
```

Definition at line [601](#) of file [spectator.c](#).

#### 4.130.2.9 ClearSpectators()

```
void ClearSpectators (
    WORD par )
```

Definition at line [675](#) of file [spectator.c](#).

00037
00038 /*
00039 *   #[ includes :
00040 *   #[ Commentary :
00041
00042 *   We use an array of SPECTATOR structs in AM.SpectatorFiles.
00043 *   When a spectator is removed this leaves a hole. This means that
00044 *   we cannot use AM.NumSpectatorFiles but always have to scan up to
00045 *   AM.SizeForSpectatorFiles which is the size of the array.
00046 *   An element is in use when it has a name. This is the name of the
00047 *   expression that is associated with it. There is also the number of
00048 *   the expression, but because the expressions are frequently renumbered
00049 *   at the end of a module, we always search for the spectators by name.
00050 *   The expression number is only valid in the current module.
00051 *   During execution we use the number of the spectator.
00052
00053 *   The FILEHANDLE struct is borrowed from the structs for the scratch
00054 *   files, but we do not keep copies for all workers as with the scratch
00055 *   files. This brings some limitations (but saves much space). Basically
00056 *   the reading can only be done by one master or worker. And because
00057 *   we use the buffer both for writing and for reading we cannot read and
00058 *   write in the same module.
00059
00060 *   Processor can see that an expression is to be filled with a spectator
00061 *   because we replace the compiler buffer number in the prototype by
00062 *   -specnum-1. Of course, after this filling has taken place we should
00063 *   make sure that in the next module there is a nonnegative number there.
00064 *   The input is then obtained from GetFromSpectator instead from GetTerm.
00065 *   This needed an extra argument in ThreadsProcessor. InParallelProcessor
00066 *   can figure it out by itself. ParFORM still needs to be treated for this.
00067
00068 *   The writing is to a single buffer. Hence it needs a lock. It is possible
00069 *   to give all workers their own buffers (at great memory cost) and merge
00070 *   the results when needed. That would be friendlier on ParFORM. We ALWAYS
00071 *   assume that the order of the terms in the spectator file is random.
00072
00073 *   In the first version there is no compression in the file. This could
00074 *   change in later versions because both the writing and the reading are
00075 *   purely sequential. Brackets are not possible.
00076
00077 *   Currently, ParFORM allows use of spectators only in the sequential
00078 *   mode. The parallelization is switched off in modules containing
00079 *   ToSpectator or CopySpectator. Workers never create or access to
00080 *   spectator files. Their file handles are always -1. We leave the
00081 *   parallelization of modules with spectators for future work.
00082
00083 *   #[ Commentary :
00084 *   #[ CoCreateSpectator :
00085
00086 *   Syntax: CreateSpectator name_of_expr "filename";

### 4.132.1 Detailed Description

This file contains the main program. It also deals with the very early stages of the startup of FORM and the final stages when the program attempts some cleanup. Here is the routine that analyses the command tail.

Definition in file [startup.c](#).

### 4.132.2 Macro Definition Documentation

#### 4.132.2.1 STRINGIFY

```
#define STRINGIFY(  
    x ) STRINGIFY__(x)
```

Definition at line 57 of file [startup.c](#).

#### 4.132.2.2 STRINGIFY\_\_

```
#define STRINGIFY__(  
    x ) #x
```

Definition at line 58 of file [startup.c](#).

#### 4.132.2.3 FORMNAME

```
#define FORMNAME "FORM"
```

Definition at line 68 of file [startup.c](#).

#### 4.132.2.4 VERSIONSTR\_\_

```
#define VERSIONSTR__ STRINGIFY(MAJORVERSION) "." STRINGIFY(MINORVERSION) "Beta"
```

Definition at line 97 of file [startup.c](#).

#### 4.132.2.5 VERSIONSTR

```
#define VERSIONSTR FORMNAME " " VERSIONSTR__ " (" PRODUCTIONDATE ") "
```

Definition at line 101 of file [startup.c](#).

#### 4.132.2.6 TAKEPATH

```
#define TAKEPATH(  
    x ) if (s[1]== '=' ) {x=s+2;} else {x=*argv++;argc--;}  

```

Definition at line [235](#) of file [startup.c](#).

#### 4.132.2.7 DEFAULTFNAMELENGTH

```
#define DEFAULTFNAMELENGTH 16
```

Definition at line [664](#) of file [startup.c](#).

### 4.132.3 Function Documentation

#### 4.132.3.1 DoTail()

```
int DoTail (  
    int argc,  
    UBYTE ** argv )  

```

Definition at line [237](#) of file [startup.c](#).

#### 4.132.3.2 OpenInput()

```
int OpenInput (  
    void )  

```

Definition at line [542](#) of file [startup.c](#).

#### 4.132.3.3 ReserveTempFiles()

```
void ReserveTempFiles (  
    int par )  

```

Definition at line [666](#) of file [startup.c](#).

#### 4.132.3.4 StartVariables()

```
void StartVariables (
    void )
```

All functions (well, nearly all) are declared here.

Definition at line 905 of file [startup.c](#).

References [AddNtoC\(\)](#), [AddRHS\(\)](#), [Compare1\(\)](#), [inicbufs\(\)](#), [FuNcTiOn::name](#), [PF\\_BroadcastNumber\(\)](#), [PutPreVar\(\)](#), and [FuNcTiOn::symmetric](#).

Here is the call graph for this function:

#### 4.132.3.5 StartMore()

```
void StartMore (
    void )
```

Definition at line 1316 of file [startup.c](#).

#### 4.132.3.6 IniVars()

```
WORD IniVars (
    void )
```

Definition at line 1354 of file [startup.c](#).

#### 4.132.3.7 main()

```
int main (
    int argc,
    char ** argv )
```

Definition at line 1660 of file [startup.c](#).

#### 4.132.3.8 Cleanup()

```
void Cleanup (
    WORD par )
```

Definition at line 1759 of file [startup.c](#).

#### 4.132.3.9 TerminateImpl()

```
void TerminateImpl (
    int errorcode,
    const char * file,
    int line,
    const char * function )
```

Definition at line 1848 of file [startup.c](#).

#### 4.132.3.10 PrintDeprecation()

```
void PrintDeprecation (
    const char * feature,
    const char * issue )
```

Prints a deprecation warning for a given feature.

##### Parameters

|                |                                           |
|----------------|-------------------------------------------|
| <i>feature</i> | The name of the deprecated feature.       |
| <i>issue</i>   | The associated issue, e.g., "issues/700". |

Definition at line 2061 of file [startup.c](#).

#### 4.132.3.11 PrintRunningTime()

```
void PrintRunningTime (
    void )
```

Definition at line 2085 of file [startup.c](#).

#### 4.132.3.12 GetRunningTime()

```
LONG GetRunningTime (
    void )
```

Definition at line 2126 of file [startup.c](#).

## 4.132.4 Variable Documentation

### 4.132.4.1 emptystring

```
UBYTE* emptystring = (UBYTE *)"."
```

Definition at line 660 of file [startup.c](#).

### 4.132.4.2 defaulttempfilename

```
UBYTE* defaulttempfilename = (UBYTE *)"xformxxx.str"
```

Definition at line 661 of file [startup.c](#).

### 4.134.3 Function Documentation

#### 4.134.3.1 OpenTemp()

```
WORD OpenTemp (
    void )
```

Definition at line [48](#) of file [store.c](#).

#### 4.134.3.2 SeekScratch()

```
void SeekScratch (
    FILEHANDLE * fi,
    POSITION * pos )
```

Definition at line [64](#) of file [store.c](#).

#### 4.134.3.3 SetEndScratch()

```
void SetEndScratch (
    FILEHANDLE * f,
    POSITION * position )
```

Definition at line 75 of file [store.c](#).

#### 4.134.3.4 SetEndHScratch()

```
void SetEndHScratch (
    FILEHANDLE * f,
    POSITION * position )
```

Definition at line 89 of file [store.c](#).

#### 4.134.3.5 SetScratch()

```
void SetScratch (
    FILEHANDLE * f,
    POSITION * position )
```

Definition at line 115 of file [store.c](#).

#### 4.134.3.6 RevertScratch()

```
WORD RevertScratch (
    void )
```

Definition at line 190 of file [store.c](#).

#### 4.134.3.7 ResetScratch()

```
WORD ResetScratch (
    void )
```

Definition at line 235 of file [store.c](#).

#### 4.134.3.8 ReadFromScratch()

```
int ReadFromScratch (
    FILEHANDLE * fi,
    POSITION * pos,
    UBYTE * buffer,
    POSITION * length )
```

Definition at line 273 of file [store.c](#).

#### 4.134.3.9 AddToScratch()

```
int AddToScratch (
    FILEHANDLE * fi,
    POSITION * pos,
    UBYTE * buffer,
    POSITION * length,
    int withflush )
```

Definition at line 300 of file [store.c](#).

#### 4.134.3.10 CoSave()

```
int CoSave (
    UBYTE * inp )
```

Definition at line 363 of file [store.c](#).

#### 4.134.3.11 CoLoad()

```
int CoLoad (
    UBYTE * inp )
```

Definition at line 573 of file [store.c](#).

#### 4.134.3.12 DeleteStore()

```
WORD DeleteStore (
    WORD par )
```

Definition at line 773 of file [store.c](#).

#### 4.134.3.13 PutInStore()

```
WORD PutInStore (
    INDEXENTRY * ind,
    WORD num )
```

Definition at line 874 of file [store.c](#).

#### 4.134.3.14 GetTerm()

```
WORD GetTerm (
    PHEAD WORD * term )
```

Definition at line 993 of file [store.c](#).

#### 4.134.3.15 GetOneTerm()

```
WORD GetOneTerm (
    PHEAD WORD * term,
    FILEHANDLE * fi,
    POSITION * pos,
    int par )
```

Definition at line 1268 of file [store.c](#).

#### 4.134.3.16 GetMoreTerms()

```
WORD GetMoreTerms (
    WORD * term )
```

Definition at line 1426 of file [store.c](#).

#### 4.134.3.17 GetMoreFromMem()

```
WORD GetMoreFromMem (
    WORD * term,
    WORD ** tpoint )
```

Definition at line 1522 of file [store.c](#).

#### 4.134.3.18 GetFromStore()

```
WORD GetFromStore (
    WORD * to,
    POSITION * position,
    RENUMBER renumber,
    WORD * InCompState,
    WORD nexpr )
```

Definition at line 1629 of file [store.c](#).

#### 4.134.3.19 DetVars()

```
void DetVars (
    WORD * term,
    WORD par )
```

Definition at line 1830 of file [store.c](#).

#### 4.134.3.20 ToStorage()

```
WORD ToStorage (
    EXPRESSIONS e,
    POSITION * length )
```

Definition at line 2017 of file [store.c](#).

#### 4.134.3.21 NextFileIndex()

```
INDEXENTRY * NextFileIndex (
    POSITION * indexpos )
```

Definition at line 2258 of file [store.c](#).

#### 4.134.3.22 SetFileIndex()

```
WORD SetFileIndex (
    void )
```

Reads the next file index and puts it into AR.StoreData.Index. TODO

##### Returns

= 0 everything okay, != 0 an error occurred

Definition at line 2321 of file [store.c](#).

References [WriteStoreHeader\(\)](#).

Here is the call graph for this function:

#### 4.134.3.23 VarStore()

```
WORD VarStore (
    UBYTE * s,
    WORD n,
    WORD name,
    WORD namesize )
```

Definition at line 2370 of file [store.c](#).

**4.134.3.24 TermRenumber()**

```
WORD TermRenumber (
    WORD * term,
    RENUMBER renumber,
    WORD nexpr )
```

!! WORD \*memterm=term; static LONG ctrap=0; !!!

!! ctrap++; !!!

Definition at line 2428 of file [store.c](#).

**4.134.3.25 FindrNumber()**

```
WORD FindrNumber (
    WORD n,
    VARRENUM * v )
```

Definition at line 2588 of file [store.c](#).

**4.134.3.26 FindInIndex()**

```
INDEXENTRY * FindInIndex (
    WORD expr,
    FILEDATA * f,
    WORD par,
    WORD mode )
```

Definition at line 2665 of file [store.c](#).

**4.134.3.27 GetTable()**

```

RENUMBER GetTable (
    WORD expr,
    POSITION * position,
    WORD mode )

```

Definition at line 2826 of file [store.c](#).

**4.134.3.28 CopyExpression()**

```

int CopyExpression (
    FILEHANDLE * from,
    FILEHANDLE * to )

```

Definition at line 3308 of file [store.c](#).

**4.134.3.29 WriteStoreHeader()**

```

WORD WriteStoreHeader (
    WORD handle )

```

Writes header with information about system architecture and FORM revision to an open store file.

Called by [SetFileIndex\(\)](#).

**Parameters**

|               |                                                     |
|---------------|-----------------------------------------------------|
| <i>handle</i> | specifies open file to which header will be written |
|---------------|-----------------------------------------------------|

**Returns**

= 0 everything okay, != 0 an error occurred

Definition at line 3972 of file [store.c](#).

References [STOREHEADER::endianness](#), [STOREHEADER::lenLONG](#), [STOREHEADER::lenPOINTER](#), [STOREHEADER::lenPOS](#), [STOREHEADER::lenWORD](#), [STOREHEADER::maxpower](#), [STOREHEADER::sFun](#), [STOREHEADER::sInd](#), [STOREHEADER::sSym](#), [STOREHEADER::sVec](#), and [STOREHEADER::wildoffset](#).

Referenced by [SetFileIndex\(\)](#).

**4.134.3.30 ReadSaveHeader()**

```

WORD ReadSaveHeader (
    void )

```

Reads the header in the save file and sets function pointers and flags according to the information found there. Must be called before any other ReadSave... function.

Currently works only for the exchange between 32bit and 64bit machines (WORD size must be 2 or 4 bytes)!

It is called by [CoLoad\(\)](#).

**Returns**

= 0 everything okay, != 0 an error occurred

Definition at line [4065](#) of file [store.c](#).

**4.134.3.31 ReadSaveIndex()**

```
WORD ReadSaveIndex (
    FILEINDEX * fileind )
```

Reads a FILEINDEX from the open save file specified by AO.SaveData.Handle. Translations for adjusting endianness and data sizes are done if necessary.

Depends on the assumption that sizeof(FILEINDEX) is the same everywhere. If FILEINDEX or INDEXENTRY change, then this functions has to be adjusted.

Called by CoLoad() and FindInIndex().

**Parameters**

|                |                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------|
| <i>fileind</i> | contains the read FILEINDEX after successful return. must point to allocated, big enough memory. |
|----------------|--------------------------------------------------------------------------------------------------|

**Returns**

= 0 everything okay, != 0 an error occurred

Definition at line [4183](#) of file [store.c](#).

References [INFILEINDEX](#), [FiLeInDeX::next](#), [FiLeInDeX::number](#), and [FuNcTiOn::number](#).

**4.134.3.32 ReadSaveVariables()**

```
WORD ReadSaveVariables (
    UBYTE * buffer,
    UBYTE * top,
    LONG * size,
    LONG * outsize,
    INDEXENTRY * ind,
    LONG * stage )
```

Reads the variables from the open file specified by AO.SaveData.Handle. It reads the \*size bytes and writes them to the \*buffer. It is called by PutInStore().

If translation is necessary, the data might shrink or grow in size, then \*size is adjusted so that the reading and writing fits into the memory from the buffer to the top. The actual number of read bytes is returned in \*size, the number of written bytes is returned in \*outsize.

If the \*size is smaller than the actual size of the variables, this function will be called several times and needs to remember the current position in the variable structure. The parameter *stage* does this job. When [ReadSaveVariables\(\)](#) is called for the first time, this parameter should have the value -1.

The parameter *ind* is used to get the number of variables.

## Parameters

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>buffer</i>  | read variables are written into this allocated memory                                                                      |
| <i>top</i>     | upper end of allocated memory                                                                                              |
| <i>size</i>    | number of bytes to read. might return a smaller number of read bytes if translation was necessary                          |
| <i>outsize</i> | if translation has be done, outsize contains the number of written bytes                                                   |
| <i>ind</i>     | pointer of INDEXENTRY for the current expression. read-only                                                                |
| <i>stage</i>   | should be -1 for the first call, will be increased by ReadSaveVariables to memorize the position in the variable structure |

## Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4369 of file [store.c](#).

References [InDeXeNtRy::nfunctions](#), [InDeXeNtRy::nindices](#), [InDeXeNtRy::nsymbols](#), [InDeXeNtRy::nvectors](#), and [FuNcTiOn::spec](#).

**4.134.3.33 ReadSaveTerm32()**

```

UBYTE * ReadSaveTerm32 (
    UBYTE * bin,
    UBYTE * binend,
    UBYTE ** bout,
    UBYTE * boutend,
    UBYTE * top,
    int terminbuf )

```

Reads a single term from the given buffer at *bin* and write the translated term back to this buffer at *bout*.

[ReadSaveTerm32\(\)](#) is currently the only instantiation of a ReadSaveTerm-function. It only deals with data that already has the correct endianness and that is resized to 32bit words but without being renumbered or translated in any other way. It uses the compress buffer [AR.CompressBuffer](#).

The function is reentrant in order to cope with nested function arguments. It is called by [ReadSaveExpression\(\)](#) and itself.

The *return value* indicates the position in the input buffer up to which the data has already been successfully processed. The parameter *bout* returns the corresponding position in the output buffer.

## Parameters

|                  |                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>bin</i>       | start of the input buffer                                                                                                       |
| <i>binend</i>    | end of the input buffer                                                                                                         |
| <i>bout</i>      | as input points to the beginning of the output buffer, as output points behind the already translated data in the output buffer |
| <i>boutend</i>   | end of already decompressed data in output buffer                                                                               |
| <i>top</i>       | end of output buffer                                                                                                            |
| <i>terminbuf</i> | flag whether decompressed data is already in the output buffer. used in recursive calls                                         |

**Returns**

pointer to the next unprocessed data in the input buffer

Definition at line 4736 of file [store.c](#).

References [ReadSaveTerm32\(\)](#).

Referenced by [ReadSaveExpression\(\)](#), and [ReadSaveTerm32\(\)](#).

Here is the call graph for this function:

**4.134.3.34 ReadSaveExpression()**

```
WORD ReadSaveExpression (
    UBYTE * buffer,
    UBYTE * top,
    LONG * size,
    LONG * outsize )
```

Reads an expression from the open file specified by `AO.SaveData.Handle`. The endianness flip and a resizing without renumbering is done in this function. Thereafter the buffer consists of chunks with a uniform maximal word size (32bit at the moment). The actual renumbering is then done by calling the function [ReadSaveTerm32\(\)](#). The result is returned in *buffer*.

If the translation at some point doesn't fit into the buffer anymore, the function returns and must be called again. In any case *size* returns the number of successfully read bytes, *outsize* returns the number of successfully written bytes, and the file will be positioned at the next byte after the successfully read data.

It is called by `PutInStore()`.

**Parameters**

|                |                                                  |
|----------------|--------------------------------------------------|
| <i>buffer</i>  | output buffer, holds the (translated) expression |
| <i>top</i>     | end of buffer                                    |
| <i>size</i>    | number of read bytes                             |
| <i>outsize</i> | number of written bytes                          |

**Returns**

= 0 everything okay, != 0 an error occurred

Definition at line 5146 of file [store.c](#).

02790 /*
02791     #] FindInIndex :
02792     #[ GetTable :
02793
02794     Locates stored files and constructs the renumbering tables.
02795     They are allocated in the WorkSpace.
02796     First the expression data are located. The Index is treated
02797     as a circularly linked buffer which is paged forwardly.
02798     If the indexentry is located (in ind) the two renumber tables
02799     have to be constructed.
02800     Finally the prototype has to be put in the proper buffer, so
02801     that wildcards can be passed. There should be a test with
02802     an already existing prototype that is constructed by the
02803     pattern matcher. This has not been put in yet.
02804
02805     There is a problem with the parallel processing.
02806     Feeding in the variables that were erased by a .store could in
02807     principle happen in different orders (ParFORM) or simultaneously
02808     (TFORM). The proper resolution is to have the compiler call GetTable
02809     when a stored expression is encountered.
02810
02811     This has been mended in development of TFORM by reading the
02812     symbol tables during compilation. See the call to GetTable
02813     in the CodeGenerator.
02814
02815     Next is the problem of FindInIndex which writes in AR.StoreData
02816     Copying this is expensive!
02817
02818     This Doesn't work well for TFORM yet!!!!!!!
02819     e[x1,x2] versus e[x2,x1] messes up.
02820     For the rest is the reloading during execution not thread safe.
02821
02822     The parameter mode tells whether we should worry about arguments
02823     of a stored expression.

03512
03513     All functions concerned with the system independent reading of save-files
03514     are here. They are called by the functions CoLoad, PutInStore,
03515     SetFileIndex, FindInIndex. In case no translation (endianness flip,
03516     resizing of words, renumbering) has to be done, they just do simple file
03517     reading. The function SaveFileHeader() for writing a header with
03518     information about the system architecture, FORM version, etc. is also
03519     located here.

## Functions

- **STATIC\_ASSERT** (sizeof([STOREHEADER](#))==512)
- **STATIC\_ASSERT** (sizeof([FILEINDEX](#))==512)

### 4.136.1 Detailed Description

Contains definitions for global structs.

!!!CAUTION!!! Changes in this file will most likely have consequences for the recovery mechanism (see [checkpoint.c](#)). You need to care for the code in [checkpoint.c](#) as well and modify the code there accordingly!

The marker [D] is used in comments in this file to mark pointers to which dynamically allocated memory is assigned by a call to malloc() during runtime (in contrast to pointers that point into already allocated memory). This information is especially helpful if one needs to know which pointers need to be freed (cf. [checkpoint.c](#)).

Definition in file [structs.h](#).

### 4.136.2 Macro Definition Documentation

#### 4.136.2.1 INFILEINDEX

```
#define INFILEINDEX ((512-2*sizeof(POSITION))/sizeof(INDEXENTRY))
```

Maximum number of entries (struct [InDeXeNrTy](#)) in a file index (struct [FiLeInDeX](#)). Number is calculated such that the size of a file index is no more than 512 bytes.

Definition at line 119 of file [structs.h](#).

#### 4.136.2.2 EMPTYININDEX

```
#define EMPTYININDEX (512-2*sizeof(POSITION)-INFILEINDEX*sizeof(INDEXENTRY))
```

Number of empty filling bytes for a file index (struct [FiLeInDeX](#)). It is calculated such that the size of a file index is always 512 bytes.

Definition at line 124 of file [structs.h](#).

#### 4.136.2.3 PHEAD

```
#define PHEAD
```

Definition at line 2646 of file [structs.h](#).

#### 4.136.2.4 PHEAD0

```
#define PHEAD0 void
```

Definition at line 2647 of file [structs.h](#).

#### 4.136.2.5 BHEAD

```
#define BHEAD
```

Definition at line 2648 of file [structs.h](#).

#### 4.136.2.6 BHEAD0

```
#define BHEAD0
```

Definition at line 2649 of file [structs.h](#).

### 4.136.3 Typedef Documentation

#### 4.136.3.1 INDEXENTRY

```
typedef struct InDeXeNtRy INDEXENTRY
```

Defines the structure of an entry in a file index (see struct [FiLeInDeX](#)).

It represents one expression in the file.

#### 4.136.3.2 FILEINDEX

```
typedef struct FiLeInDeX FILEINDEX
```

Defines the structure of a file index in store-files and save-files.

It contains several entries (see struct [InDeXeNtRy](#)) up to a maximum of [INFILEINDEX](#).

The variable number has been made of type POSITION to avoid padding problems with some types of computers/↔ OS and keep system independence of the .sav files.

This struct is always 512 bytes long.

#### 4.136.3.3 VARRENUM

```
typedef struct VaRrEnUm VARRENUM
```

Contains the pointers to an array in which a binary search will be performed.

#### 4.136.3.4 RENUMBER

```
typedef struct ReNuMbEr * RENUMBER
```

Only symb.lo gets dynamically allocated. All other pointers points into this memory.

#### 4.136.3.5 NAMENODE

```
typedef struct NaMeNode NAMENODE
```

The names of variables are kept in an array. Elements of type [NAMENODE](#) define a tree (that is kept balanced) that make it easy and fast to look for variables. See also [NAMETREE](#).

#### 4.136.3.6 NAMETREE

```
typedef struct NaMeTree NAMETREE
```

A struct of type [NAMETREE](#) controls a complete (balanced) tree of names for the compiler. The compiler maintains several of such trees and the system has been set up in such a way that one could define more of them if we ever want to work with local name spaces.

#### 4.136.3.7 COMPTREE

```
typedef struct tree COMPTREE
```

The subexpressions in the compiler are kept track of in a (balanced) tree to reduce the need for subexpressions and hence save much space in large rhs expressions (like when we have xxxxxx occurrences of objects like  $f(x+1, x+1)$  in which each  $x+1$  becomes a subexpression. The struct that controls this tree is COMPTREE.

#### 4.136.3.8 TABLES

```
typedef struct TaBles * TABLES
```

buffers, mm, flags, and prototype are always dynamically allocated, tablepointers only if needed (=0 if unallocated), boomlijst and argtail only for sparse tables.

Allocation is done for both the normal and the stub instance (spare), except for prototype and argtail which share memory.

#### 4.136.3.9 FUNCTIONS

```
typedef struct FuNcTiOn * FUNCTIONS
```

Contains all information about a function. Also used for tables. It is used in the [LIST](#) elements of AC.

#### 4.136.3.10 FILEHANDLE

```
typedef struct FiLe FILEHANDLE
```

The type FILEHANDLE is the struct that controls all relevant information of a file, whether it is open or not. The file may even not yet exist. There is a system of caches (PObuffer) and as long as the information to be written still fits inside the cache the file may never be created. There are variables that can store information about different types of files, like scratch files or sort files. Depending on what is available in the system we may also have information about gzip compression (currently sort file only) or locks (TFORM).

#### 4.136.3.11 STREAM

```
typedef struct StreaM STREAM
```

Input is read from 'streams' which are represented by objects of type STREAM. A stream can be a file, a do-loop, a procedure, the string value of a preprocessor variable ..... When a new stream is opened we have to keep information about where to fall back in the parent stream to allow this to happen even in the middle of reading names etc as would be the case with a`i'b

#### 4.136.3.12 TRACES

```
typedef struct TrAcEs TRACES
```

The struct TRACES keeps track of the progress during the expansion of a 4-dimensional trace. Each time a term gets generated the expansion tree continues in the next statement. When it returns it has to know where to continue. The 4-dimensional traces are more complicated than the n-dimensional traces (see TRACEN) because of the extra tricks that can be used. They are responsible for the shorter final expressions.

#### 4.136.3.13 TRACEN

```
typedef struct TrAcEn * TRACEN
```

The struct TRACEN keeps track of the progress during the expansion of a 4-dimensional trace. Each time a term gets generated the expansion tree continues in the next statement. When it returns it has to know where to continue.

#### 4.136.3.14 PREVAR

```
typedef struct pReVaR PREVAR
```

An element of the type PREVAR is needed for each preprocessor variable.

#### 4.136.3.15 DOLOOP

```
typedef struct DoLoOp DOLOOP
```

Each preprocessor do loop has a struct of type DOLOOP to keep track of all relevant parameters like where the beginning of the loop is, what the boundaries, increment and value of the loop parameter are, etc. Also we keep the whole loop inside a buffer of type [PRELOAD](#)

#### 4.136.3.16 set\_of\_char

```
typedef struct bit_field set_of_char[32]
```

Used in [set\\_in](#), [set\\_set](#), [set\\_del](#) and [set\\_sub](#).

Definition at line [952](#) of file [structs.h](#).

#### 4.136.3.17 one\_byte

```
typedef struct bit_field* one_byte
```

Used in [set\\_in](#), [set\\_set](#), [set\\_del](#) and [set\\_sub](#).

Definition at line [958](#) of file [structs.h](#).

#### 4.136.3.18 FINISHUFFLE

```
typedef WORD(* FINISHUFFLE) (WORD *)
```

Definition at line [978](#) of file [structs.h](#).

#### 4.136.3.19 DO\_UFFLE

```
typedef WORD(* DO_UFFLE) (WORD *, WORD, WORD, WORD)
```

Definition at line [979](#) of file [structs.h](#).

#### 4.136.3.20 COMPAREDUMMY

```
typedef WORD(* COMPAREDUMMY) (WORD *, WORD *, WORD)
```

Definition at line [984](#) of file [structs.h](#).

#### 4.136.3.21 CBUF

```
typedef struct CbUf CBUF
```

The CBUF struct is used by the compiler. It is a compiler buffer of which since version 3.0 there can be many.

#### 4.136.3.22 CHANNEL

```
typedef struct ChAnNeL CHANNEL
```

When we read input from text files we have to remember not only their handle but also their name. This is needed for error messages. Hence we call such a file a channel and reserve a struct of type `CHANNEL` to allow to lay this link.

#### 4.136.3.23 NESTING

```
typedef struct NeStInG * NESTING
```

The `NESTING` struct is used when we enter the argument of functions and there is the possibility that we have to change something there. Because functions can be nested we have to keep track of all levels of functions in case we have to move the outer layers to make room for a larger function argument.

#### 4.136.3.24 STORECACHE

```
typedef struct StOrEcAcHe * STORECACHE
```

The struct of type `STORECACHE` is used by a caching system for reading terms from stored expressions. Each thread should have its own system of caches.

#### 4.136.3.25 PERM

```
typedef struct PeRmUtE PERM
```

The struct `PERM` is used to generate all permutations when the pattern matcher has to try to match (anti)symmetric functions.

#### 4.136.3.26 PERMP

```
typedef struct PeRmUtEp PERMP
```

Like struct `PERM` but works with pointers.

#### 4.136.3.27 DISTRIBUTE

```
typedef struct DiStRiBuTe DISTRIBUTE
```

The struct `DISTRIBUTE` is used to help the pattern matcher when matching antisymmetric tensors.

#### 4.136.3.28 PARTI

```
typedef struct PaRtI PARTI
```

The struct `PARTI` is used to help determining whether a `partition_` function can be replaced.

#### 4.136.3.29 SORTING

```
typedef struct sOrT SORTING
```

The struct SORTING is used to control a sort operation. It includes a small and a large buffer and arrays for keeping track of various stages of the (merge) sorts. Each sort level has its own struct and different levels can have different sizes for its arrays. Also different threads have their own set of SORTING structs.

#### 4.136.3.30 ALLGLOBALS

```
typedef struct AllGlobals ALLGLOBALS
```

Without pthreads (FORM) the ALLGLOBALS struct has all the global variables

#### 4.136.3.31 WCN

```
typedef WORD(* WCN) ()
```

Definition at line 2656 of file [structs.h](#).

#### 4.136.3.32 WCN2

```
typedef WORD(* WCN2) ()
```

Definition at line 2657 of file [structs.h](#).

#### 4.136.3.33 COMPARE

```
typedef WORD(* COMPARE) (PHEAD WORD *, WORD *, WORD)
```

Definition at line 2660 of file [structs.h](#).

#### 4.136.3.34 FIXEDGLOBALS

```
typedef struct FixedGlobals FIXEDGLOBALS
```

The FIXEDGLOBALS struct is an anachronism. It started as the struct with global variables that needed initialization. It contains the elements Operation and OperaFind which define a very early way of automatically jumping to the proper operation. We find the results of it in parts of the file [opera.c](#). Later operations were treated differently in a more transparent way. We never changed the existing code. The most important part is currently the cTable which is used intensively in the compiler.

### 4.138.1 Detailed Description

The routines that deal with the pattern matching of functions with symmetric properties.

Definition in file [symmetr.c](#).

### 4.138.2 Function Documentation

#### 4.138.2.1 MatchE()

```
WORD MatchE (
    PHEAD WORD * pattern,
    WORD * fun,
    WORD * inter,
    WORD par )
```

Definition at line 56 of file [symmetr.c](#).

#### 4.138.2.2 Permute()

```
WORD Permute (
    PERM * perm,
    WORD first )
```

Definition at line 443 of file [symmetr.c](#).

#### 4.138.2.3 PermuteP()

```
WORD PermuteP (
    PERMP * perm,
    WORD first )
```

Definition at line 477 of file [symmetr.c](#).

#### 4.138.2.4 Distribute()

```
WORD Distribute (
    DISTRIBUTE * d,
    WORD first )
```

Definition at line 509 of file [symmetr.c](#).

#### 4.138.2.5 MatchCy()

```
int MatchCy (
    PHEAD WORD * pattern,
    WORD * fun,
    WORD * inter,
    WORD par )
```

Definition at line 570 of file [symmetr.c](#).

#### 4.138.2.6 FunMatchCy()

```
int FunMatchCy (
    PHEAD WORD * pattern,
    WORD * fun,
    WORD * inter,
    WORD par )
```

Definition at line 1066 of file [symmetr.c](#).

#### 4.138.2.7 FunMatchSy()

```
int FunMatchSy (
    PHEAD WORD * pattern,
    WORD * fun,
    WORD * inter,
    WORD par )
```

Definition at line 1524 of file [symmetr.c](#).

## 4.138.2.8 MatchArgument()

```
int MatchArgument (
    PHEAD WORD * arg,
    WORD * pat )
```

Definition at line 2051 of file [symmetr.c](#).

## 4.139 symmetr.c

00039 #[] Includes :
00040 #[] MatchE : WORD MatchE(pattern,fun,inter,par)
00041
00042 Matches symmetric and antisymmetric tensors.
00043 Pattern and fun point at a tensor.
00044 Problem is the wildcarding and all its possible permutations.
00045 This routine loops over all of them and calls for each
00046 possible wildcarding the recursion in ScanFunctions.
00047 Note that this can be very costly.
00048
00049 Originally this routine did only Levi Civita tensors and hence
00050 it dealt only with commuting objects.
00051 Because of the backtracking we cannot fall back to the calling
00052 ScanFunctions routine and check the sequence of functions when
00053 non-commuting objects are involved.

00427
00428     Special permutation function.
00429     Works recursively.
00430     The aim is to cycle through in as fast a way as possible,
00431     to take care that each object hits the various positions
00432     already early in the game.
00433
00434     Start at two: -> cycle of two
00435     then three -> cycle of three
00436     etc;
00437     The innermost cycle is the longest. This is the opposite
00438     of the usual way of generating permutations and it is
00439     certainly not the fastest one. It allows for the fastest
00440     hit in the assignment of wildcards though.

## 4.140.1 Detailed Description

Contains all functions that deal with the table bases on the 'FORM level' The low level database routines are in [minos.c](#)

Definition in file [tables.c](#).

## 4.140.2 Function Documentation

### 4.140.2.1 ClearTableTree()

```
void ClearTableTree (  
    TABLES T )
```

Definition at line 72 of file [tables.c](#).

### 4.140.2.2 InsTableTree()

```
int InsTableTree (  
    TABLES T,  
    WORD * tp )
```

Definition at line 103 of file [tables.c](#).

### 4.140.2.3 RedoTableTree()

```
void RedoTableTree (  
    TABLES T,  
    int newsiz )
```

Definition at line 266 of file [tables.c](#).

### 4.140.2.4 FindTableTree()

```
int FindTableTree (  
    TABLES T,  
    WORD * tp,  
    int inc )
```

Definition at line 291 of file [tables.c](#).

#### 4.140.2.5 DoTableExpansion()

```
WORD DoTableExpansion (
    WORD * term,
    WORD level )
```

Definition at line 334 of file [tables.c](#).

#### 4.140.2.6 CoTableBase()

```
int CoTableBase (

00032 /*
00033 *   #[ Includes :
00034 *
00035 *   File contains the routines for the tree structure of sparse tables
00036 *   We insert elements by
00037 *   InsTableTree(T,tp) with T the TABLES element and tp the pointer
00038 *   to the indices.
00039 *   We look for elements with
00040 *   FindTableTree(T,tp,inc) with T the TABLES element, tp the pointer to the
00041 *   indices or the function arguments and inc tells which of these options.
00042 *   The tree is cleared with ClearTableTree(T) and we rebuild the tree
00043 *   after a .store in which we lost a part of the table with
00044 *   RedoTableTree(T,newsize)
00045 *
00046 *   In T->tablepointers we have the lists of indices for each element.
00047 *   Additionally for each element there is an extension. There are
00048 *   TABLEEXTENSION WORDs reserved for that. The old system had two words
00049 *   One for the element in the rhs of the compile buffer and one for
00050 *   an additional rhs in case the original would be overwritten by a new
00051 *   definition, but the old was fixed by .global and hence it should be possible
00052 *   to restore it.
00053 *   New use (new = 24-sep-2001)
00054 *   rhs1,numCompBuffer1,rhs2,numCompBuffer2,usage
00055 *   Hence TABLEEXTENSION will be 5. Note that for 64 bits the use of the
00056 *   compiler buffer is overdoing it a bit, but it would be too complicated
00057 *   to try to give it special code.

00565 #] DoTableExpansion :
00566 #[ TableBase :
00567
00568 File with all the database related things.
00569 We have the routines for the generic database command
00570 TableBase,options;
00571 TB,options;
00572 Options are:
00573     Open "File.tbl";           Open for R/W
00574     Open "File.tbl", readonly; Open for R
00575     Create "File.tbl";         Create for write
00576     Load "File.tbl", tablename; Loads stubs of table
00577     Load "File.tbl";           Loads stubs of all tables
00578     Enter "File.tbl", tablename; Loads whole table
00579     Enter "File.tbl";          Loads all tables
00580     Audit "File.tbl", options; Print list of contents
00581     Replace "File.tbl", tablename; Saves a table (with overwrite)
00582     Replace "File.tbl", table element; Saves a table element
00583     Cleanup "File.tbl";        Makes tables contingent
00584     AddTo "File.tbl" tablename; Add if not yet there.
00585     AddTo "File.tbl" table element; Add if not yet there.
00586     Delete "File.tbl" tablename;
00587     Delete "File.tbl" table element;
00588
00589     On/Off substitute;
00590     On/Off compress "File.tbl";
00591     id tbl_(f?,?a) = f(?a);
00592     When a tbl_ is used, automatically the corresponding element is compiled

```

```

00593     at the start of the next module.
00594     if TB,On,substitute [tablename], use of table RHS (if loaded)
00595     if TB,Off,substitute [tablename], use of tbl_(table,...);
00596
00597
00598     Still needed: Something like OverLoad to allow loading parts of a table
00599     from more than one file. Date stamps needed? In that case we need a touch
00600     command as well.
00601
00602     If we put all our diagrams inside, we have to go outside the concept
00603     of tables.

02021 #] Apply :
02022 #[ ApplyExec :
02023
02024 Replaces occurrences of tbl_(table,indices,pattern) by the proper
02025 rhs of table(indices,pattern). It does this up to maxtogo times
02026 in the given term. It starts with the occurrences inside the
02027 arguments of functions. If necessary it finishes at groundlevel.
02028 An infinite number of tries is indicated by maxtogo = 2^15-1 or 2^31-1.
02029 The occurrences are replaced by subexpressions. This allows TestSub
02030 to finish the job properly.
02031
02032 The main trick here is T = T->spare which turns to the proper rhs.
02033
02034 The return value is the number of substitutions that can still be made
02035 based on maxtogo. Hence, if the returnvalue is different from maxtogo
02036 there was a substitution.

## 4.142 threads.c File Reference

### 4.142.1 Detailed Description

Routines for the interface of FORM with the pthreads library

This is the main part of the parallelization of TFORM. It is important to also look in the files [structs.h](#) and [variable.h](#) because the treatment of the A and B structs is essential (these structs are used by means of the macros AM, AP, AC, AS, AR, AT, AN, AO and AX). Also the definitions and use of the macros BHEAD and PHEAD should be looked up.

The sources are set up in such a way that if WITHPTHREADS isn't defined there is no trace of pthread parallelization. The reason is that TFORM is far more memory hungry than sequential FORM.

Special attention should also go to the locks. The proper use of the locks is essential and determines whether TFORM can work at all. We use the LOCK/UNLOCK macros which are empty in the case of sequential FORM. These locks are at many places in the source files when workers can interfere with each others data or with the data of the master.

Definition in file [threads.c](#).

00055  The sortbot additions are from 17-may-2007 and after. They constitute

```

```

00056     an attempt to make the final merge sorting faster for the master.
00057     This way the master has only one compare per term.
00058     It does add some complexity, but the final merge routine (MasterMerge)
00059     is much simpler for the sortbots. On the other hand the original merging is
00060     for a large part a copy of the MergePatches routine in sort.c and hence
00061     even though complex the bad part has been thoroughly debugged.

00404     12-jun-2007 JV:
00405     For the timing one has to know a few things:
00406     The POSIX standard is that there is only a single process ID and that
00407     getrusage returns the time of all the threads together.
00408     Under Linux there are two methods though: The older LinuxThreads and NPTL.
00409     LinuxThreads gives each thread its own process id. This makes that we
00410     can time the threads with getrusage, and hence this was done. Under NPTL
00411     this has been 'corrected' and suddenly getrusage doesn't work anymore the
00412     way it used to. Now we need
00413     clock_gettime(CLOCK_THREAD_CPUTIME_ID,&timing)
00414     which is declared in <time.h> and we need -lrt extra in the link statement.
00415     (this is at least the case on blade02 at DESY-Zeuthen).
00416     See also the code in tools.c at the routine Timer.

03128
03129         There is still a serious problem.
03130         When for instance a sum_, there may be space created in a local
03131         compiler buffer for a wildcard substitution or whatever.
03132         Compiler buffer execution scribble space.....
03133         This isn't copied along?
03134         Look up ebufnum. There are 12 places with AddRHS!
03135         Problem: one process allocates in ebuf. Then term is given to
03136         other process. It would like to use from this ebuf, but the sender
03137         finishes first and removes the ebuf (and/or overwrites it).
03138
03139         Other problem: local $ variables aren't copied along.

### 4.144.1 Detailed Description

The tokenizer. This is a part of the compiler that does an intermediate type of translation. It does look up the names etc and can do a number of optimizations. The resulting output is a stream of bytes which can be processed by the code generator (in the file [compiler.c](#))

Definition in file [token.c](#).

## 4.144.2 Macro Definition Documentation

### 4.144.2.1 CHECKPOLY

```
#define CHECKPOLY {if(polyflag)MesPrint("&Illegal use of polynomial function"); polyflag = 0;
}
```

Definition at line 56 of file [token.c](#).

## 4.144.3 Function Documentation

### 4.144.3.1 tokenize()

```
int tokenize (
    UBYTE * in,
    WORD leftright )
```

Definition at line 58 of file [token.c](#).

### 4.144.3.2 WriteTokens()

```
void WriteTokens (
    SBYTE * in )
```

Definition at line 657 of file [token.c](#).

### 4.144.3.3 simp1token()

```
int simp1token (
    SBYTE * s )
```

Definition at line 705 of file [token.c](#).

### 4.144.3.4 simpwtoken()

```
int simpwtoken (
    SBYTE * s )
```

Definition at line 794 of file [token.c](#).

### 4.144.3.5 simp2token()

```
int simp2token (
    SBYTE * s )
```

Definition at line 948 of file [token.c](#).

#### 4.144.3.6 simp3atoken()

```
int simp3atoken (
    SBYTE * s,
    int mode )
```

Definition at line 1196 of file [token.c](#).

#### 4.144.3.7 simp3btoken()

```
int simp3btoken (
    SBYTE * s,
    int mode )
```

Definition at line 1437 of file [token.c](#).

#### 4.144.3.8 simp4token()

```
int simp4token (
    SBYTE * s )
```

Definition at line 1822 of file [token.c](#).

#### 4.144.3.9 simp5token()

```
int simp5token (
    SBYTE * s,
    int mode )
```

Definition at line 1982 of file [token.c](#).

#### 4.144.3.10 simp6token()

```
int simp6token (
    SBYTE * tokens,
    int mode )
```

Definition at line 2028 of file [token.c](#).

### 4.144.4 Variable Documentation

#### 4.144.4.1 ttypes

00780     Only to be called in the LHS.
00781     Hunts down the wildcards and writes them to the wildcardbuffer.

```

```

00782         Next it causes the ProtoType to be constructed.
00783         All wildcards are simplified into the trailing TWILDCARD,
00784         because the specifics are stored in the prototype.
00785         These specifics also include the transfer of wildcard values
00786         to $variables.
00787
00788         Types of wildcards:
00789         a?, a?set, a?!set, a?set[i], A?set1?set2, ?a
00790         After this we can strip the set information.
00791         We still need the ? because of the wildcarding offset in code generation

### 4.146.1 Detailed Description

Low level routines for many types of task. There are routines for manipulating the input system (streams and files) routines for string manipulation, the memory allocation interface, and the clock. The last is the most sensitive to ports. In the past nearly every port to another OS or computer gave trouble. Nowadays it is slightly better but the poor POSIX compliance of LINUX again gave problems for the multithreaded version.

Definition in file [tools.c](#).

### 4.146.2 Macro Definition Documentation

#### 4.146.2.1 FILLVALUE

```
#define FILLVALUE 0
```

Definition at line 49 of file [tools.c](#).

#### 4.146.2.2 TERMMEMSTARTNUM

```
#define TERMMEMSTARTNUM 16
```

Provides memory for one term (or one small polynomial) This means that the memory is limited to a buffer of size AM.MaxTer plus a few extra words. In parallel versions, each worker has its own memory pool.

The way we use the memory is by: term = TermMalloc(BHEAD0); and later we free it by TermFree(BHEAD term);

Layout: We have a list of available pointers to buffers: AT.TermMemHeap Its size is AT.TermMemMax We take from the top (indicated by AT.TermMemTop). When we run out of buffers we assign new ones (doubling the amount) and we have to extend the AT.TermMemHeap array. Important: There is no checking that the returned memory is legal, ie is memory that was handed out earlier.

Definition at line 2547 of file [tools.c](#).

#### 4.146.2.3 TERMEXTRAWORDS

```
#define TERMEXTRAWORDS 10
```

Definition at line 2548 of file [tools.c](#).

#### 4.146.2.4 NUMBERMEMSTARTNUM

```
#define NUMBERMEMSTARTNUM 16
```

Provides memory for one Long number This means that the memory is limited to a buffer of size AM.MaxTal In parallel versions, each worker has its own memory pool.

The way we use the memory is by: num = NumberMalloc(BHEAD0); Number = AT.NumberMemHeap[num]; and later we free it by NumberFree(BHEAD num);

Layout: We have a list of available pointers to buffers: AT.NumberMemHeap Its size is AT.NumberMemMax We take from the top (indicated by AT.NumberMemTop). When we run out of buffers we assign new ones (doubling the amount) and we have to extend the AT.NumberMemHeap array. Important: There is no checking on the returned memory!!!!

Definition at line 2647 of file [tools.c](#).

#### 4.146.2.5 NUMBEREXTRAWORDS

```
#define NUMBEREXTRAWORDS 10L
```

Definition at line 2648 of file [tools.c](#).

#### 4.146.2.6 DODOUBLE

```
#define DODOUBLE(  
    x )
```

**Value:**

```
{ x *s, *t, *u; if ( *start ) { \
    oldsize = *(x **)stop - *(x **)start; newsize = 2*oldsize; \
    t = u = (x *)Malloca1(newsize*sizeof(x),text); s = *(x **)start; \
    for ( i = 0; i < oldsize; i++ ) { *t++ = *s++; } M_free(*start,"double"); } \
    else { newsize = 100; u = (x *)Malloca1(newsize*sizeof(x),text); } \
    *start = (void *)u; *stop = (void *) (u+newsize); }
```

Definition at line 2970 of file [tools.c](#).

#### 4.146.2.7 DOEXPAND

```
#define DOEXPAND(  
    x )
```

**Value:**

```
{ x *newbuffer, *t, *m; \
    t = newbuffer = (x *)Malloca1((newsize+2)*type,"ExpandBuffer"); \
    if ( *buffer ) { m = (x *)*buffer; i = *oldsize; \
        while ( --i >= 0 ) { *t++ = *m++; } M_free(*buffer,"ExpandBuffer"); \
    } *buffer = newbuffer; *oldsize = newsize; }
```

Definition at line 2996 of file [tools.c](#).

### 4.146.3 Function Documentation

#### 4.146.3.1 LoadInputFile()

```
UBYTE * LoadInputFile (  
    UBYTE * filename,  
    int type )
```

Definition at line 112 of file [tools.c](#).

#### 4.146.3.2 ReadFromStream()

```
UBYTE ReadFromStream (  
    STREAM * stream )
```

Definition at line 151 of file [tools.c](#).

#### 4.146.3.3 GetFromStream()

```
UBYTE GetFromStream (  
    STREAM * stream )
```

Definition at line 286 of file [tools.c](#).

#### 4.146.3.4 LookInStream()

```
UBYTE LookInStream (  
    STREAM * stream )
```

Definition at line 309 of file [tools.c](#).

#### 4.146.3.5 OpenStream()

```
STREAM * OpenStream (  
    UBYTE * name,  
    int type,  
    int prevarmode,  
    int raiselow )
```

Definition at line 321 of file [tools.c](#).

#### 4.146.3.6 LocateFile()

```
int LocateFile (  
    UBYTE ** name,  
    int type )
```

Definition at line 576 of file [tools.c](#).

#### 4.146.3.7 CloseStream()

```
STREAM * CloseStream (  
    STREAM * stream )
```

Definition at line 663 of file [tools.c](#).

#### 4.146.3.8 CreateStream()

```
STREAM * CreateStream (  
    UBYTE * where )
```

Definition at line 782 of file [tools.c](#).

#### 4.146.3.9 GetStreamPosition()

```
LONG GetStreamPosition (
    STREAM * stream )
```

Definition at line 813 of file [tools.c](#).

#### 4.146.3.10 PositionStream()

```
void PositionStream (
    STREAM * stream,
    LONG position )
```

Definition at line 823 of file [tools.c](#).

#### 4.146.3.11 ReverseStatements()

```
int ReverseStatements (
    STREAM * stream )
```

Definition at line 855 of file [tools.c](#).

#### 4.146.3.12 StartFiles()

```
void StartFiles (
    void )
```

Definition at line 956 of file [tools.c](#).

#### 4.146.3.13 OpenFile()

```
int OpenFile (
    char * name )
```

Definition at line 983 of file [tools.c](#).

#### 4.146.3.14 OpenAddFile()

```
int OpenAddFile (
    char * name )
```

Definition at line 1002 of file [tools.c](#).

#### 4.146.3.15 ReOpenFile()

```
int ReOpenFile (
    char * name )
```

Definition at line 1023 of file [tools.c](#).

#### 4.146.3.16 CreateFile()

```
int CreateFile (
    char * name )
```

Definition at line 1043 of file [tools.c](#).

#### 4.146.3.17 CreateLogFile()

```
int CreateLogFile (
    char * name )
```

Definition at line 1060 of file [tools.c](#).

#### 4.146.3.18 CloseFile()

```
void CloseFile (
    int handle )
```

Definition at line 1078 of file [tools.c](#).

#### 4.146.3.19 CopyFile()

```
int CopyFile (
    char * source,
    char * dest )
```

Copies a file with name \*source to a file named \*dest. The involved files must not be open. Returns non-zero if an error occurred. Uses if possible the combined large and small sorting buffers as cache.

Definition at line 1101 of file [tools.c](#).

Referenced by [DoRecovery\(\)](#).

#### 4.146.3.20 CreateHandle()

```
int CreateHandle (
    void )
```

Definition at line 1162 of file [tools.c](#).

#### 4.146.3.21 ReadFile()

```
LONG ReadFile (
    int handle,
    UBYTE * buffer,
    LONG size )
```

Definition at line 1217 of file [tools.c](#).

#### 4.146.3.22 ReadPosFile()

```
LONG ReadPosFile (
    PHEAD FILEHANDLE * fi,
    UBYTE * buffer,
    LONG size,
    POSITION * pos )
```

Definition at line 1267 of file [tools.c](#).

#### 4.146.3.23 WriteFileToFile()

```
LONG WriteFileToFile (
    int handle,
    UBYTE * buffer,
    LONG size )
```

Definition at line 1333 of file [tools.c](#).

#### 4.146.3.24 SeekFile()

```
void SeekFile (
    int handle,
    POSITION * offset,
    int origin )
```

Definition at line 1371 of file [tools.c](#).

#### 4.146.3.25 TellFile()

```
LONG TellFile (
    int handle )
```

Definition at line 1396 of file [tools.c](#).

#### 4.146.3.26 TELLFILE()

```
void TELLFILE (
    int handle,
    POSITION * position )
```

Definition at line 1406 of file [tools.c](#).

#### 4.146.3.27 FlushFile()

```
void FlushFile (
    int handle )
```

Definition at line 1420 of file [tools.c](#).

**4.146.3.28 GetPosFile()**

```
int GetPosFile (
    int handle,
    fpos_t * pospointer )
```

Definition at line [1434](#) of file [tools.c](#).

**4.146.3.29 SetPosFile()**

```
int SetPosFile (
    int handle,
    fpos_t * pospointer )
```

Definition at line [1448](#) of file [tools.c](#).

**4.146.3.30 SynchFile()**

```
void SynchFile (
    int handle )
```

Definition at line [1468](#) of file [tools.c](#).

**4.146.3.31 TruncateFile()**

```
void TruncateFile (
    int handle )
```

Definition at line [1490](#) of file [tools.c](#).

**4.146.3.32 GetChannel()**

```
int GetChannel (
    char * name,
    int mode )
```

Definition at line [1510](#) of file [tools.c](#).

**4.146.3.33 GetAppendChannel()**

```
int GetAppendChannel (
    char * name )
```

Definition at line [1546](#) of file [tools.c](#).

#### 4.146.3.34 CloseChannel()

```
int CloseChannel (
    char * name )
```

Definition at line 1576 of file [tools.c](#).

#### 4.146.3.35 UpdateMaxSize()

```
void UpdateMaxSize (
    void )
```

Definition at line 1610 of file [tools.c](#).

#### 4.146.3.36 StrCmp()

```
int StrCmp (
    UBYTE * s1,
    UBYTE * s2 )
```

Definition at line 1700 of file [tools.c](#).

#### 4.146.3.37 StrICmp()

```
int StrICmp (
    UBYTE * s1,
    UBYTE * s2 )
```

Definition at line 1711 of file [tools.c](#).

#### 4.146.3.38 StrHICmp()

```
int StrHICmp (
    UBYTE * s1,
    UBYTE * s2 )
```

Definition at line 1722 of file [tools.c](#).

#### 4.146.3.39 StrICont()

```
int StrICont (
    UBYTE * s1,
    UBYTE * s2 )
```

Definition at line 1733 of file [tools.c](#).

#### 4.146.3.40 CmpArray()

```
int CmpArray (
    WORD * t1,
    WORD * t2,
    WORD n )
```

Definition at line 1745 of file [tools.c](#).

#### 4.146.3.41 ConWord()

```
int ConWord (
    UBYTE * s1,
    UBYTE * s2 )
```

Definition at line 1759 of file [tools.c](#).

#### 4.146.3.42 StrLen()

```
int StrLen (
    UBYTE * s )
```

Definition at line 1771 of file [tools.c](#).

#### 4.146.3.43 NumToStr()

```
void NumToStr (
    UBYTE * s,
    LONG x )
```

Definition at line 1783 of file [tools.c](#).

#### 4.146.3.44 WriteString()

```
void WriteString (
    int type,
    UBYTE * str,
    int num )
```

Definition at line 1807 of file [tools.c](#).

#### 4.146.3.45 WriteUnfinString()

```
void WriteUnfinString (
    int type,
    UBYTE * str,
    int num )
```

Definition at line 1841 of file [tools.c](#).

#### 4.146.3.46 AddToString()

```
UBYTE * AddToString (
    UBYTE * outstring,
    UBYTE * extrastring,
    int par )
```

Definition at line [1866](#) of file [tools.c](#).

#### 4.146.3.47 strDup1()

```
UBYTE * strDup1 (
    UBYTE * instring,
    char * ifwrong )
```

Definition at line [1904](#) of file [tools.c](#).

#### 4.146.3.48 EndOfToken()

```
UBYTE * EndOfToken (
    UBYTE * s )
```

Definition at line [1919](#) of file [tools.c](#).

#### 4.146.3.49 ToToken()

```
UBYTE * ToToken (
    UBYTE * s )
```

Definition at line [1931](#) of file [tools.c](#).

#### 4.146.3.50 SkipField()

```
UBYTE * SkipField (
    UBYTE * s,
    int level )
```

Definition at line [1946](#) of file [tools.c](#).

#### 4.146.3.51 ReadSnum()

```
WORD ReadSnum (
    UBYTE ** p )
```

Definition at line [1973](#) of file [tools.c](#).

#### 4.146.3.52 NumCopy()

```
UBYTE * NumCopy (
    WORD y,
    UBYTE * to )
```

Definition at line 1997 of file [tools.c](#).

#### 4.146.3.53 LongCopy()

```
char * LongCopy (
    LONG y,
    char * to )
```

Definition at line 2024 of file [tools.c](#).

#### 4.146.3.54 LongLongCopy()

```
char * LongLongCopy (
    off_t * y,
    char * to )
```

Definition at line 2051 of file [tools.c](#).

#### 4.146.3.55 MakeDate()

```
UBYTE * MakeDate (
    void )
```

Definition at line 2090 of file [tools.c](#).

#### 4.146.3.56 set\_in()

```
int set_in (
    UBYTE ch,
    set_of_char set )
```

Definition at line 2112 of file [tools.c](#).

#### 4.146.3.57 set\_set()

```
one_byte set_set (
    UBYTE ch,
    set_of_char set )
```

Definition at line 2132 of file [tools.c](#).

**4.146.3.58 set\_del()**

```
one_byte set_del (
    UBYTE ch,
    set_of_char set )
```

Definition at line 2153 of file [tools.c](#).

**4.146.3.59 set\_sub()**

```
one_byte set_sub (
    set_of_char set,
    set_of_char set1,
    set_of_char set2 )
```

Definition at line 2175 of file [tools.c](#).

**4.146.3.60 iniTools()**

```
void iniTools (
    void )
```

Definition at line 2201 of file [tools.c](#).

**4.146.3.61 Malloc()**

```
void * Malloc (
    LONG size )
```

Definition at line 2221 of file [tools.c](#).

**4.146.3.62 Malloc1()**

```
void * Malloc1 (
    LONG size,
    const char * messageifwrong )
```

Definition at line 2303 of file [tools.c](#).

**4.146.3.63 M\_free()**

```
void M_free (
    void * x,
    const char * where )
```

Definition at line 2383 of file [tools.c](#).

**4.146.3.64 M\_check1()**

```
void M_check1 (
    void )
```

Definition at line 2516 of file [tools.c](#).

**4.146.3.65 M\_print()**

```
void M_print (
    void )
```

Definition at line 2517 of file [tools.c](#).

**4.146.3.66 TermMallocAddMemory()**

```
void TermMallocAddMemory (
    PHEAD0 )
```

Definition at line 2550 of file [tools.c](#).

**4.146.3.67 NumberMallocAddMemory()**

```
void NumberMallocAddMemory (
    PHEAD0 )
```

Definition at line 2654 of file [tools.c](#).

**4.146.3.68 CacheNumberMallocAddMemory()**

```
void CacheNumberMallocAddMemory (
    PHEAD0 )
```

Definition at line 2728 of file [tools.c](#).

**4.146.3.69 FromList()**

```
void * FromList (
    LIST * L )
```

Definition at line 2780 of file [tools.c](#).

**4.146.3.70 From0List()**

```
void * From0List (
    LIST * L )
```

Definition at line 2806 of file [tools.c](#).

#### 4.146.3.71 FromVarList()

```
void * FromVarList (
    LIST * L )
```

Definition at line 2835 of file [tools.c](#).

#### 4.146.3.72 DoubleList()

```
int DoubleList (
    void *** lijst,
    int * oldsize,
    int objectsize,
    char * nameoftype )
```

Definition at line 2877 of file [tools.c](#).

#### 4.146.3.73 DoubleLList()

```
int DoubleLList (
    void *** lijst,
    LONG * oldsize,
    int objectsize,
    char * nameoftype )
```

Definition at line 2929 of file [tools.c](#).

#### 4.146.3.74 DoubleBuffer()

```
void DoubleBuffer (
    void ** start,
    void ** stop,
    int size,
    char * text )
```

Definition at line 2977 of file [tools.c](#).

#### 4.146.3.75 ExpandBuffer()

```
void ExpandBuffer (
    void ** buffer,
    LONG * oldsize,
    int type )
```

Definition at line 3002 of file [tools.c](#).

**4.146.3.76 iexp()**

```
LONG iexp (
    LONG x,
    int p )
```

Definition at line [3026](#) of file [tools.c](#).

**4.146.3.77 ToGeneral()**

```
void ToGeneral (
    WORD * r,
    WORD * m,
    WORD par )
```

Definition at line [3057](#) of file [tools.c](#).

**4.146.3.78 ToFast()**

```
int ToFast (
    WORD * r,
    WORD * m )
```

Definition at line [3101](#) of file [tools.c](#).

**4.146.3.79 ToPolyFunGeneral()**

```
WORD ToPolyFunGeneral (
    PHEAD WORD * term )
```

Definition at line [3154](#) of file [tools.c](#).

**4.146.3.80 IsLikeVector()**

```
int IsLikeVector (
    WORD * arg )
```

Definition at line [3229](#) of file [tools.c](#).

**4.146.3.81 AreArgsEqual()**

```
int AreArgsEqual (
    WORD * arg1,
    WORD * arg2 )
```

Definition at line [3257](#) of file [tools.c](#).

#### 4.146.3.82 CompareArgs()

```
int CompareArgs (
    WORD * arg1,
    WORD * arg2 )
```

Definition at line 3276 of file [tools.c](#).

#### 4.146.3.83 CompArg()

```
int CompArg (
    WORD * s1,
    WORD * s2 )
```

Definition at line 3307 of file [tools.c](#).

#### 4.146.3.84 TimeWallClock()

```
LONG TimeWallClock (
    WORD par )
```

Returns the wall-clock time.

##### Parameters

|            |                                                  |
|------------|--------------------------------------------------|
| <i>par</i> | If zero, the wall-clock time will be reset to 0. |
|------------|--------------------------------------------------|

##### Returns

The wall-clock time in centiseconds.

#### 4.146.3.85 TimeChildren()

```
LONG TimeChildren (
    WORD par )
```

Definition at line 3533 of file [tools.c](#).

#### 4.146.3.86 TimeCPU()

```
LONG TimeCPU (
    WORD par )
```

Returns the CPU time.

## Parameters

|            |                                           |
|------------|-------------------------------------------|
| <i>par</i> | If zero, the CPU time will be reset to 0. |
|------------|-------------------------------------------|

## Returns

The CPU time in milliseconds.

Definition at line 3551 of file [tools.c](#).

Referenced by [PF\\_GetSlaveTimes\(\)](#), [PF\\_Processor\(\)](#), and [WriteStats\(\)](#).

**4.146.3.87 Crash()**

```
int Crash (
    void )
```

Definition at line 3834 of file [tools.c](#).

**4.146.3.88 TestTerm()**

```
int TestTerm (
    WORD * term )
```

Tests the consistency of the term. Returns 0 when the term is OK. Any nonzero value is trouble. In the current version the testing isn't 100% complete. For instance, we don't check the validity of the symbols nor do we check the range of their powers. Etc. This should be extended when the need is there.

## Parameters

|             |                       |
|-------------|-----------------------|
| <i>term</i> | the term to be tested |
|-------------|-----------------------|

Definition at line 3862 of file [tools.c](#).

01243     #[ ReadPosFile :
01244
01245     Gets words from a file(handle).
01246     First tries to get the information from the buffers.
01247     Reads a file at a position. Updates the position.
01248     Places a lock in the case of multithreading.
01249     Exists for multiple reading from the same file.
01250     size is the number of WORDs to read!!!!
01251
01252     We may need some strategy in the caching. This routine is used from
01253     GetOneTerm only. The problem is when it reads brackets and the
01254     brackets are read backwards. This is very uneconomical because
01255     each time it may read a large buffer.
01256     On the other hand, reading piece by piece in GetOneTerm takes
01257     much overhead as well.
01258     Two strategies come to mind:
01259     1: keep things as they are but limit the size of the buffers.
01260     2: have the position of 'pos' at about 1/3 of the buffer.
01261         this is of course guess work.
01262     Currently we have implemented the first method by creating the
01263     setup parameter threadscratchsize with the default value 100K.
01264     In the test program much bigger values gave a slower program.

03617             Only to be used in combination with WITHPTHREADS
03618             This clock seems to be supported by the standard.
03619             The getusage clock returns according to the standard only the combined
03620             time of the whole process. But in older versions of Linux LinuxThreads
03621             is used which gives a separate id to each thread and individual timings.
03622             In NPTL we get, according to the standard, one combined timing.
03623             To get individual timings we need to use

```

### 4.150.1 Detailed Description

Routines that deal with the transform statement and its varieties.

Definition in file [transform.c](#).

### 4.150.2 Function Documentation

#### 4.150.2.1 CoTransform()

```
int CoTransform (  
    UBYTE * in )
```

Definition at line [87](#) of file [transform.c](#).

#### 4.150.2.2 RunTransform()

```
WORD RunTransform (  
    PHEAD WORD * term,  
    WORD * params )
```

Definition at line [732](#) of file [transform.c](#).

#### 4.150.2.3 RunEncode()

```
WORD RunEncode (  
    PHEAD WORD * fun,  
    WORD * args,  
    WORD * info )
```

Definition at line [982](#) of file [transform.c](#).

#### 4.150.2.4 RunDecode()

```
WORD RunDecode (  
    PHEAD WORD * fun,  
    WORD * args,  
    WORD * info )
```

Definition at line [1169](#) of file [transform.c](#).

#### 4.150.2.5 RunReplace()

```
WORD RunReplace (
    PHEAD WORD * fun,
    WORD * args,
    WORD * info )
```

Definition at line 1339 of file [transform.c](#).

#### 4.150.2.6 RunImplode()

```
WORD RunImplode (
    WORD * fun,
    WORD * args )
```

Definition at line 1817 of file [transform.c](#).

#### 4.150.2.7 RunExplode()

```
WORD RunExplode (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line 2018 of file [transform.c](#).

#### 4.150.2.8 RunPermute()

```
WORD RunPermute (
    PHEAD WORD * fun,
    WORD * args,
    WORD * info )
```

Definition at line 2132 of file [transform.c](#).

#### 4.150.2.9 RunReverse()

```
WORD RunReverse (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line 2359 of file [transform.c](#).

#### 4.150.2.10 RunDedup()

```
WORD RunDedup (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line 2446 of file [transform.c](#).

#### 4.150.2.11 RunCycle()

```
WORD RunCycle (
    PHEAD WORD * fun,
    WORD * args,
    WORD * info )
```

Definition at line 2535 of file [transform.c](#).

#### 4.150.2.12 RunAddArg()

```
WORD RunAddArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line 2687 of file [transform.c](#).

#### 4.150.2.13 RunMulArg()

```
WORD RunMulArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line 2774 of file [transform.c](#).

#### 4.150.2.14 RunIsLyndon()

```
WORD RunIsLyndon (
    PHEAD WORD * fun,
    WORD * args,
    int par )
```

Definition at line 2913 of file [transform.c](#).

#### 4.150.2.15 RunToLyndon()

```
WORD RunToLyndon (
    PHEAD WORD * fun,
    WORD * args,
    int par )
```

Definition at line 2991 of file [transform.c](#).

#### 4.150.2.16 RunDropArg()

```
WORD RunDropArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line 3103 of file [transform.c](#).

#### 4.150.2.17 RunSelectArg()

```
WORD RunSelectArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line 3129 of file [transform.c](#).

#### 4.150.2.18 RunZtoHArg()

```
WORD RunZtoHArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line 3157 of file [transform.c](#).

#### 4.150.2.19 RunHtoZArg()

```
WORD RunHtoZArg (
    PHEAD WORD * fun,
    WORD * args )
```

Definition at line 3212 of file [transform.c](#).

#### 4.150.2.20 TestArgNum()

```
int TestArgNum (
    int n,
    int totarg,
    WORD * args )
```

Definition at line 3277 of file [transform.c](#).

#### 4.150.2.21 PutArgInScratch()

```
WORD PutArgInScratch (
    WORD * arg,
    UWORD * scrat )
```

Definition at line 3346 of file [transform.c](#).

#### 4.150.2.22 ReadRange()

```
UBYTE * ReadRange (
    UBYTE * s,
    WORD * out,
    int par )
```

Definition at line 3382 of file [transform.c](#).

## 4.150.2.23 FindRange()

```
int FindRange (
    PHEAD WORD * args,
    WORD * arg1,
    WORD * arg2,
    WORD totarg )
```

Definition at line 3542 of file [transform.c](#).

00037 /*
00038  #[] Includes :
00039  #[] Transform :
00040  #[] Intro :
00041
00042  Here are the routines for the transform statement. This is a
00043  group of transformations on function arguments or groups of
00044  function arguments. The purpose of this command is that it
00045  avoids repetitive pattern matching.
00046  Syntax:
00047      Transform,SetOfFunctions,OneOrMoreTransformations;
00048  Each transformation is given by
00049      Replace(argfirst,arglast)=(,,)
00050      Encode(argfirst,arglast):base=#
00051      Decode(argfirst,arglast):base=#
00052      Implode(argfirst,arglast)
00053      Explode(argfirst,arglast)
00054      Permute(cycle)(cycle)(cycle)...(cycle)
00055      Reverse(argfirst,arglast)
00056      Dedup(argfirst,arglast)
00057      Cycle(argfirst,arglast)=+/-num
00058      IsLyndon(argfirst,arglast)=(yes,no)
00059      ToLyndon(argfirst,arglast)=(yes,no)
00060  In replace the extra information is
00061      a replace_() without the name of the replace_ function.
00062      This can be as in (0,1,1,0) or (xarg_,1-xarg_) to indicate
00063      a symbolic argument or (x,y,y,x) to exchange x and y, etc.
00064  In Encode and Decode argfirst is the most significant 'word' and
00065  arglast is the least significant 'word'.
00066  Note that we need to introduce the generic symbolic arguments xarg_,
```

```

00067     parg_, iarg_ and farg_.
00068     Examples:
00069         Transform,{H,E}
00070             ,Replace(1:'WEIGHT')=(0,1,1,0)
00071             ,Encode(1:'WEIGHT')=base(2);
00072         Transform,{H,E}
00073             ,Decode(1:'WEIGHT')=base(3)
00074             ,Replace(1:'WEIGHT')=(2,-1,1,0,0,1);
00075     Others that can be added:
00076         symmetrize?
00077
00078     6-may-2016: Changed MAXPOSITIVE2 into MAXPOSITIVE4. This makes room
00079         for the use of dollar variables as arguments.

### 4.156.1 Detailed Description

Contains a number of defines to make the coding easier. Especially the defines for the use of the lists are very nice. And of course the AC for A.Cc and AT for either A.T of B->T are indispensable to keep FORM and TFORM in one set of sources.

Definition in file [variable.h](#).

### 4.156.2 Macro Definition Documentation

#### 4.156.2.1 chartype

```
#define chartype FG.cTable
```

Definition at line [77](#) of file [variable.h](#).

#### 4.156.2.2 Procedures

```
#define Procedures ((PROCEDURE *) (AP.ProcList.lijst))
```

Definition at line [79](#) of file [variable.h](#).

#### 4.156.2.3 NumProcedures

```
#define NumProcedures AP.ProcList.num
```

Definition at line [80](#) of file [variable.h](#).

#### 4.156.2.4 MaxProcedures

```
#define MaxProcedures AP.ProcList.maxnum
```

Definition at line [81](#) of file [variable.h](#).

#### 4.156.2.5 DoLoops

```
#define DoLoops ((DOLOOP *) (AP.LoopList.lijst))
```

Definition at line 82 of file [variable.h](#).

#### 4.156.2.6 NumDoLoops

```
#define NumDoLoops AP.LoopList.num
```

Definition at line 83 of file [variable.h](#).

#### 4.156.2.7 MaxDoLoops

```
#define MaxDoLoops AP.LoopList.maxnum
```

Definition at line 84 of file [variable.h](#).

#### 4.156.2.8 PreVar

```
#define PreVar ((PREVAR *) (AP.PreVarList.lijst))
```

Definition at line 85 of file [variable.h](#).

#### 4.156.2.9 NumPre

```
#define NumPre AP.PreVarList.num
```

Definition at line 86 of file [variable.h](#).

#### 4.156.2.10 MaxNumPre

```
#define MaxNumPre AP.PreVarList.maxnum
```

Definition at line 87 of file [variable.h](#).

#### 4.156.2.11 SetElements

```
#define SetElements ((WORD *) (AC.SetElementList.lijst))
```

Definition at line 88 of file [variable.h](#).

#### 4.156.2.12 Sets

```
#define Sets ((SETS) (AC.SetList.lijst))
```

Definition at line 89 of file [variable.h](#).

#### 4.156.2.13 functions

```
#define functions ((FUNCTIONS) (AC.FunctionList.lijt))
```

Definition at line 90 of file [variable.h](#).

#### 4.156.2.14 indices

```
#define indices ((INDICES) (AC.IndexList.lijt))
```

Definition at line 91 of file [variable.h](#).

#### 4.156.2.15 symbols

```
#define symbols ((SYMBOLS) (AC.SymbolList.lijt))
```

Definition at line 92 of file [variable.h](#).

#### 4.156.2.16 vectors

```
#define vectors ((VECTORS) (AC.VectorList.lijt))
```

Definition at line 93 of file [variable.h](#).

#### 4.156.2.17 tablebases

```
#define tablebases ((DBASE *) (AC.TableBaseList.lijt))
```

Definition at line 94 of file [variable.h](#).

#### 4.156.2.18 NumFunctions

```
#define NumFunctions AC.FunctionList.num
```

Definition at line 95 of file [variable.h](#).

#### 4.156.2.19 NumIndices

```
#define NumIndices AC.IndexList.num
```

Definition at line 96 of file [variable.h](#).

#### 4.156.2.20 NumSymbols

```
#define NumSymbols AC.SymbolList.num
```

Definition at line 97 of file [variable.h](#).

#### 4.156.2.21 NumVectors

```
#define NumVectors AC.VectorList.num
```

Definition at line 98 of file [variable.h](#).

#### 4.156.2.22 NumSets

```
#define NumSets AC.SetList.num
```

Definition at line 99 of file [variable.h](#).

#### 4.156.2.23 NumSetElements

```
#define NumSetElements AC.SetElementList.num
```

Definition at line 100 of file [variable.h](#).

#### 4.156.2.24 NumTableBases

```
#define NumTableBases AC.TableBaseList.num
```

Definition at line 101 of file [variable.h](#).

#### 4.156.2.25 GlobalFunctions

```
#define GlobalFunctions AC.FunctionList.numglobal
```

Definition at line 102 of file [variable.h](#).

#### 4.156.2.26 GlobalIndices

```
#define GlobalIndices AC.IndexList.numglobal
```

Definition at line 103 of file [variable.h](#).

#### 4.156.2.27 GlobalSymbols

```
#define GlobalSymbols AC.SymbolList.numglobal
```

Definition at line 104 of file [variable.h](#).

#### 4.156.2.28 GlobalVectors

```
#define GlobalVectors AC.VectorList.numglobal
```

Definition at line 105 of file [variable.h](#).

#### 4.156.2.29 GlobalSets

```
#define GlobalSets AC.SetList.numglobal

### 4.158.1 Detailed Description

An implementation of dynamic array.

Example:

```
size_t i;
Vector(int, vec);
VectorPushBack(vec, 1);
VectorPushBack(vec, 2);
VectorPushBack(vec, 3);
for ( i = 0; i < VectorSize(vec); i++ )
    printf("%d\n", VectorPtr(vec)[i]);
VectorFree(vec);
```

Definition in file [vector.h](#).

### 4.158.2 Macro Definition Documentation

#### 4.158.2.1 VectorStruct

```
#define VectorStruct(
    T )
```

Value:

```
struct { \
    T *ptr; \
    size_t size; \
    size_t capacity; \
}
```

A struct for vector objects.

Parameters

|          |                       |
|----------|-----------------------|
| <i>T</i> | the type of elements. |
|----------|-----------------------|

Definition at line 65 of file [vector.h](#).

#### 4.158.2.2 Vector

```
#define Vector(
    T,
    X ) VectorStruct(T) X = { NULL, 0, 0 }
```

Defines and initialises a vector X of the type T. The user must call [VectorFree\(X\)](#) after the use of X.

Parameters

|          |                           |
|----------|---------------------------|
| <i>T</i> | the type of elements.     |
| <i>X</i> | the name of vector object |

Definition at line 84 of file [vector.h](#).

### 4.158.2.3 DeclareVector

```
#define DeclareVector(  
    T,  
    X )  VectorStruct (T) X
```

Declares a vector X of the type T. The user must call [VectorInit\(X\)](#) before the use of X.

#### Parameters

|          |                           |
|----------|---------------------------|
| <i>T</i> | the type of elements.     |
| <i>X</i> | the name of vector object |

Definition at line 99 of file [vector.h](#).

### 4.158.2.4 VectorInit

```
#define VectorInit(  
    X )
```

#### Value:

```
do { \  
    (X).ptr = NULL; \  
    (X).size = 0; \  
    (X).capacity = 0; \  
} while (0)
```

Initialises a vector X of the type T. The user must call [VectorFree\(X\)](#) after the use of X.

#### Parameters

|          |                    |
|----------|--------------------|
| <i>X</i> | the vector object. |
|----------|--------------------|

Definition at line 113 of file [vector.h](#).

### 4.158.2.5 VectorFree

```
#define VectorFree(  
    X )
```

#### Value:

```
do { \  
    M_free((X).ptr, "VectorFree:" #X); \  
    (X).ptr = NULL; \  
    (X).size = 0; \  
    (X).capacity = 0; \  
} while (0)
```

Frees the buffer allocated by the vector X.

#### Parameters

|          |                    |
|----------|--------------------|
| <i>X</i> | the vector object. |
|----------|--------------------|

Definition at line 130 of file [vector.h](#).

#### 4.158.2.6 VectorPtr

```
#define VectorPtr(  
    X )    ((X).ptr)
```

Returns the pointer to the buffer for the vector X. NULL when [VectorCapacity\(X\)](#) == 0.

##### Parameters

|   |                    |
|---|--------------------|
| X | the vector object. |
|---|--------------------|

##### Returns

the pointer to the allocated buffer for the vector.

Definition at line 150 of file [vector.h](#).

#### 4.158.2.7 VectorFront

```
#define VectorFront(  
    X )    ((X).ptr[0])
```

Returns the first element of the vector X. Undefined when [VectorSize\(X\)](#) == 0.

##### Parameters

|   |                    |
|---|--------------------|
| X | the vector object. |
|---|--------------------|

##### Returns

the first element of the vector.

Definition at line 165 of file [vector.h](#).

#### 4.158.2.8 VectorBack

```
#define VectorBack(  
    X )    ((X).ptr[(X).size - 1])
```

Returns the last element of the vector X. Undefined when [VectorSize\(X\)](#) == 0.

##### Parameters

|   |                    |
|---|--------------------|
| X | the vector object. |
|---|--------------------|

**Returns**

the last element of the vector.

Definition at line 180 of file [vector.h](#).

**4.158.2.9 VectorSize**

```
#define VectorSize(  
    X )    ((X).size)
```

Returns the size of the vector X.

**Parameters**

|          |                    |
|----------|--------------------|
| <i>X</i> | the vector object. |
|----------|--------------------|

**Returns**

the size of the vector.

Definition at line 194 of file [vector.h](#).

**4.158.2.10 VectorCapacity**

```
#define VectorCapacity(  
    X )    ((X).capacity)
```

Returns the capacity (the number of the already allocated elements) of the vector X.

**Parameters**

|          |                    |
|----------|--------------------|
| <i>X</i> | the vector object. |
|----------|--------------------|

**Returns**

the capacity of the vector.

Definition at line 208 of file [vector.h](#).

**4.158.2.11 VectorEmpty**

```
#define VectorEmpty(  
    X )    ((X).size == 0)
```

Returns true the size of the vector X is zero.

**Parameters**

|          |                    |
|----------|--------------------|
| <i>X</i> | the vector object. |
|----------|--------------------|

**Returns**

true if the vector has no elements, false otherwise.

Definition at line 222 of file [vector.h](#).

**4.158.2.12 VectorClear**

```
#define VectorClear(  
    X )    do { (X).size = 0; } while (0)
```

Sets the size of the vector *X* to zero.

**Parameters**

|          |                    |
|----------|--------------------|
| <i>X</i> | the vector object. |
|----------|--------------------|

Definition at line 235 of file [vector.h](#).

**4.158.2.13 VectorReserve**

```
#define VectorReserve(  
    X,  
    newcapacity )
```

**Value:**

```
do { \
    size_t v_tmp_newcapacity_ = (newcapacity); \
    if ( (X).capacity < v_tmp_newcapacity_ ) { \
        void *v_tmp_newptr_; \
        v_tmp_newcapacity_ = (v_tmp_newcapacity_ * 3) / 2; \
        if ( v_tmp_newcapacity_ < 4 ) v_tmp_newcapacity_ = 4; \
        v_tmp_newptr_ = Malloc1(sizeof((X).ptr[0]) * v_tmp_newcapacity_, "VectorReserve:" #X); \
        if ( (X).ptr != NULL ) { \
            memcpy(v_tmp_newptr_, (X).ptr, (X).size * sizeof((X).ptr[0])); \
            M_free((X).ptr, "VectorReserve:" #X); \
        } \
        (X).ptr = v_tmp_newptr_; \
        (X).capacity = v_tmp_newcapacity_; \
    } \
} while (0)
```

Requires that the capacity of the vector *X* is equal to or larger than *newcapacity*.

**Parameters**

|                    |                              |
|--------------------|------------------------------|
| <i>X</i>           | the vector object.           |
| <i>newcapacity</i> | the capacity to be reserved. |

Definition at line 249 of file [vector.h](#).

**4.158.2.14 VectorPushBack**

```
#define VectorPushBack(
    X,
    x )
```

**Value:**

```
do { \
    VectorReserve((X), (X).size + 1); \
    (X).ptr[(X).size++] = (x); \
} while (0)
```

Adds an element *x* at the end of the vector *X*.

**Parameters**

|          |                          |
|----------|--------------------------|
| <i>X</i> | the vector object.       |
| <i>x</i> | the element to be added. |

Definition at line 277 of file [vector.h](#).

**4.158.2.15 VectorPushBacks**

```
#define VectorPushBacks(
    X,
    src,
    n )
```

**Value:**

```
do { \
    size_t v_tmp_n_ = (n); \
    VectorReserve((X), (X).size + v_tmp_n_); \
    memcpy((X).ptr + (X).size, (src), v_tmp_n_ * sizeof((X).ptr[0])); \
    (X).size += v_tmp_n_; \
} while (0)
```

Adds an *n* elements of *src* at the end of the vector *X*.

**Parameters**

|            |                                                                  |
|------------|------------------------------------------------------------------|
| <i>X</i>   | the vector object.                                               |
| <i>src</i> | the starting address of the buffer storing elements to be added. |
| <i>n</i>   | the number of elements to be added.                              |

Definition at line 295 of file [vector.h](#).

**4.158.2.16 VectorPopBack**

```
#define VectorPopBack(
    X ) do { (X).size --; } while (0)
```

Removes the last element of the vector *X*. [VectorSize\(X\)](#) must be  $> 0$ .

## Parameters

|          |                    |
|----------|--------------------|
| <i>X</i> | the vector object. |
|----------|--------------------|

Definition at line 314 of file [vector.h](#).

**4.158.2.17 VectorInsert**

```
#define VectorInsert(  
    X,  
    index,  
    x )
```

**Value:**

```
do { \
    size_t v_tmp_index_ = (index); \
    VectorReserve((X), (X).size + 1); \
    memmove((X).ptr + v_tmp_index_ + 1, (X).ptr + v_tmp_index_, ((X).size - v_tmp_index_) * \
    sizeof((X).ptr[0])); \
    (X).ptr[v_tmp_index_] = (x); \
    (X).size++; \
} while (0)
```

Inserts an element *x* at the specified index of the vector *X*. The index must be  $0 \leq \text{index} < \text{VectorSize}(X)$ .

## Parameters

|              |                                                     |
|--------------|-----------------------------------------------------|
| <i>X</i>     | the vector object.                                  |
| <i>index</i> | the position at which the element will be inserted. |
| <i>x</i>     | the element to be inserted.                         |

Definition at line 330 of file [vector.h](#).

**4.158.2.18 VectorInserts**

```
#define VectorInserts(  
    X,  
    index,  
    src,  
    n )
```

**Value:**

```
do { \
    size_t v_tmp_index_ = (index), v_tmp_n_ = (n); \
    VectorReserve((X), (X).size + v_tmp_n_); \
    memmove((X).ptr + v_tmp_index_ + v_tmp_n_, (X).ptr + v_tmp_index_, ((X).size - v_tmp_index_) * \
    sizeof((X).ptr[0])); \
    memcpy((X).ptr + v_tmp_index_, (src), v_tmp_n_ * sizeof((X).ptr[0])); \
    (X).size += v_tmp_n_; \
} while (0)
```

Inserts an *n* elements of *src* at the specified index of the vector *X*. The index must be  $0 \leq \text{index} < \text{VectorSize}(X)$ .

## Parameters

|              |                                                                     |
|--------------|---------------------------------------------------------------------|
| <i>X</i>     | the vector object.                                                  |
| <i>index</i> | the position at which the elements will be inserted.                |
| <i>src</i>   | the starting address of the buffer storing elements to be inserted. |
| <i>n</i>     | the number of elements to be inserted.                              |

Definition at line 353 of file [vector.h](#).

#### 4.158.2.19 VectorErase

```
#define VectorErase(  
    X,  
    index )
```

##### Value:

```
do { \
    size_t v_tmp_index_ = (index); \
    memmove((X).ptr + v_tmp_index_, (X).ptr + v_tmp_index_ + 1, ((X).size - v_tmp_index_ - 1) * \
    sizeof((X).ptr[0])); \
    (X).size--; \
} while (0)
```

Removes an element at the specified index of the vector X. The index must be  $0 \leq \text{index} < \text{VectorSize}(X)$ .

##### Parameters

|              |                                            |
|--------------|--------------------------------------------|
| <i>X</i>     | the vector object.                         |
| <i>index</i> | the position of the element to be removed. |

Definition at line 374 of file [vector.h](#).

#### 4.158.2.20 VectorErases

```
#define VectorErases(  
    X,  
    index,  
    n )
```

##### Value:

```
do { \
    size_t v_tmp_index_ = (index), v_tmp_n_ = (n); \
    memmove((X).ptr + v_tmp_index_, (X).ptr + v_tmp_index_ + v_tmp_n_, ((X).size - v_tmp_index_ - 1) * \
    sizeof((X).ptr[0])); \
    (X).size -= v_tmp_n_; \
} while (0)
```

Removes an n elements at the specified index of the vector X. The index must be  $0 \leq \text{index} < \text{VectorSize}(X) - n + 1$ .

##### Parameters

|              |                                                      |
|--------------|------------------------------------------------------|
| <i>X</i>     | the vector object.                                   |
| <i>index</i> | the starting position of the elements to be removed. |
| <i>n</i>     | the number of elements to be removed.                |

- int [DenToFunction](#) (WORD \*term, WORD numfun)

### 4.160.1 Detailed Description

Contains the functions that deal with the wildcards. During the pattern matching there are two steps: 1: check that a wildcard substitution is correct (if there was already an assignment for this variable, it is the same; it is part of the proper set; it is the proper type of variables, etc.) 2: make the assignment In addition we have to be able to clear assignments. During execution we have to make the actual replacements (WildFill)

Definition in file [wildcard.c](#).

### 4.160.2 Macro Definition Documentation

#### 4.160.2.1 DEBUG

```
#define DEBUG(
    x )
```

Definition at line 44 of file [wildcard.c](#).

### 4.160.3 Function Documentation

#### 4.160.3.1 WildFill()

```
WORD WildFill (
    PHEAD WORD * to,
    WORD * from,
    WORD * sub )
```

Definition at line 65 of file [wildcard.c](#).

#### 4.160.3.2 ResolveSet()

```
WORD ResolveSet (
    PHEAD WORD * from,
    WORD * to,
    WORD * subs )
```

Definition at line 1361 of file [wildcard.c](#).

#### 4.160.3.3 ClearWild()

```
void ClearWild (
    PHEAD0 )
```

Definition at line 1518 of file [wildcard.c](#).

#### 4.160.3.4 AddWild()

```
WORD AddWild (
    PHEAD WORD oldnumber,
    WORD type,
    WORD newnumber )
```

Definition at line 1544 of file [wildcard.c](#).

#### 4.160.3.5 CheckWild()

```
WORD CheckWild (
    PHEAD WORD oldnumber,
    WORD type,
    WORD newnumber,
    WORD * newval )
```

Definition at line 1791 of file [wildcard.c](#).

## 4.160.3.6 DenToFunction()

```
int DenToFunction (
    WORD * term,
    WORD numFun )
```

Definition at line 2556 of file [wildcard.c](#).

01768 #] AddWild :
01769 #[ CheckWild :      WORD CheckWild(oldnumber,type,newnumber,newval)
01770
01771 Tests whether a wildcard assignment is allowed.
01772 A return value of zero means that it is allowed (nihil obstat).
01773 If the variable has been assigned already its existing
01774 assignment is returned in AN.oldvalue and AN.oldtype, which are
01775 global variables.
01776
01777 Note the special problem with name?set[i]. Here we have to pass
01778 an extra assignment. This cannot be done via globals as we
01779 call CheckWild sometimes twice before calling AddWild.
01780 Trick: Check the assignment of the number and if OK put it
01781 in place, but don't alter the used flag (if needed).
01782 Then AddWild can alter the used flag but the value is there.
01783 As long as this trick is 'hanging' we turn on the flag:
01784 'AN.WildReserve' which is either turned off by AddWild or by
01785 a failing call to CheckWild.
01786
01787 With ARGTOARG the tensors give the number of arguments
01788 or-ed with EATTENSOR which is at least 8192.
