4.29.3 Function Documentation

4.29.3.1 PackFloat()

```
int PackFloat (
    WORD * fun,
    mpf_t infloat )
```

Definition at line 271 of file [float.c](#).

4.29.3.2 UnpackFloat()

```
int UnpackFloat (
    mpf_t outfloat,
    WORD * fun )
```

Definition at line 366 of file [float.c](#).

4.29.3.3 RatToFloat()

```
void RatToFloat (
    mpf_t result,
    UWORD * formrat,
    int ratsize )
```

Definition at line 622 of file [float.c](#).

4.29.3.4 FormtoZ()

```
void FormtoZ (
    mpz_t z,
    UWORD * a,
    WORD na )
```

Definition at line 513 of file [float.c](#).

4.29.3.5 IntegerToFloatr()

```
void IntegerToFloatr (
    mpfr_t result,
    UWORD * formlong,
    int longsize )
```

Definition at line 65 of file [evaluate.c](#).

4.29.3.6 RatToFloatr()

```
void RatToFloatr (
    mpfr_t result,
    UWORD * format,
    int ratsize )
```

Definition at line 81 of file [evaluate.c](#).

4.29.3.7 SetFloatPrecision()

```
void SetFloatPrecision (
    LONG prec )
```

Definition at line 108 of file [evaluate.c](#).

4.29.3.8 ClearFloat()

```
void ClearFloat (
    void )
```

Definition at line 141 of file [evaluate.c](#).

4.29.3.9 GetFloatArgument()

```
int GetFloatArgument (
    PHEAD mpfr_t f_out,
    WORD * fun,
    int par )
```

Definition at line 180 of file [evaluate.c](#).

4.29.3.10 GetPiArgument()

```
int GetPiArgument (
    PHEAD WORD * arg )
```

Definition at line 275 of file [evaluate.c](#).

4.29.3.11 EvaluateFun()

```
int EvaluateFun (
    PHEAD WORD * term,
    WORD level,
    WORD * pars )
```

Definition at line 368 of file [evaluate.c](#).

00340 /*
00341     #] GetPiArgument :
00342     #[ EvaluateFun :
00343
00344     What we need to do is:
00345     1: look for a function to be treated.
00346     2: make sure its argument is treatable.
00347     3: call the proper mpfr_ function.
00348     4: accumulate the result.
00349     For some functions we have to insert 'smart' shortcuts as is
00350     the case with sin_(pi_) or sin_(pi_/6) of sqrt(4/9) etc.
00351     Otherwise we may have to insert a value for pi_ first.
00352     There are several types of arguments:
00353     a: (short) integers.
00354     b: rationals.
00355     c: floats.
00356     We accumulate the result(s) in auxr2. The argument comes in aux5
00357     and a result in auxr3 which then gets multiplied into auxr2.
00358     In the end we have to combine auxr2 with whatever coefficient
00359     existed already.
00360
00361     When the float system is started we need for aux only 3 variables
00362     per thread. auxr1-auxr3. This should be done separately.
00363     The main problem is the conversion of mpfr_t to float_ and/or mpf_t
00364     and back.

4.31.1 Detailed Description

The routines that start the execution phase of a module. It also contains the routines for placing the bracket subterm.

Definition in file [execute.c](#).

4.31.2 Macro Definition Documentation

4.31.2.1 CURRENTBRACKET

```
#define CURRENTBRACKET 1
```

```

Definition at line 1656 of file [execute.c](#).

4.31.3.11 ExchangeExpressions()

```
void ExchangeExpressions (
    int num1,
    int num2 )
```

Definition at line 1671 of file [execute.c](#).

4.31.3.12 GetFirstBracket()

```
int GetFirstBracket (
    WORD * term,
    int num )
```

Definition at line 1745 of file [execute.c](#).

4.31.3.13 GetFirstTerm()

```
int GetFirstTerm (
    WORD * term,
    int num,
    int pre )
```

Gets the first term of an expression. Routine should be thread safe.

Parameters

out	<i>term</i>	Pointer to the buffer where the term should be written.
in	<i>num</i>	The expression number from which to get the term.
in	<i>pre</i>	Denotes a pre-processor call (1) or not (0). Used to determine the correct source file for the expression.

Returns

First WORD of term, a negative value denotes an error.

4.33.1 Detailed Description

The system that takes care of communication with external programs.

Definition in file [extcmd.c](#).

4.33.2 Function Documentation

4.33.2.1 openExternalChannel()

```
int openExternalChannel (
    UBYTE * cmd,
    int daemonize,
    UBYTE * shellname,
    UBYTE * stderrname )
```

Definition at line [230](#) of file [extcmd.c](#).

4.33.2.2 initPresetExternalChannels()

```
int initPresetExternalChannels (
    UBYTE * theline,
    int thetimeout )
```

Definition at line [232](#) of file [extcmd.c](#).

4.33.2.3 closeExternalChannel()

```
int closeExternalChannel (
    int n )
```

Definition at line [233](#) of file [extcmd.c](#).

4.33.2.4 selectExternalChannel()

```
int selectExternalChannel (
    int n )
```

Definition at line [234](#) of file [extcmd.c](#).

4.33.2.5 getCurrentExternalChannel()

```
int getCurrentExternalChannel (
    void )
```

Definition at line 235 of file [extcmd.c](#).

4.33.2.6 closeAllExternalChannels()

```
void closeAllExternalChannels (
    void )
```

Definition at line 236 of file [extcmd.c](#).

00031 /*
00032    #[] Documentation :
00033
00034    This module is written by M.Tentyukov as a part of implementation of
00035    interaction between FORM and external processes, first release
00036    09.04.2004. A part of this code is copied from the DIANA project, which was
00037    written by M. Tentyukov and published under the GPL version 2 as
00038    published by the Free Software Foundation.
00039
00040    This file is completely re-written by M.Tentyukov in May 2006.
00041    Since the interface was changed, the public function were changed,
00042    also. A new public functions were added: initPresetExternalChannels()
00043    (see comments just before this function in the present file) and
00044    setKillModeForExternalChannel (a pointer, not a function).
00045
00046    If a macro WITHEXTERNALCHANNEL is not defined, all public functions
00047    are stubs returning failure.
00048
00049    The idea is to start an external command swallowing
00050    its stdin and stdout. This can be done by means of the function
00051    int openExternalChannel(cmd,daemonize,shellname,stderrname), where
00052    cmd is a command to run,
00053    daemonize: if !=0 then start the command in the "daemon" mode,
00054    shellname: if !=NULL, execute the command in a subshell,
00055    stderrname: if != NULL, redirect stderr of the command to this file.
00056    The function returns some small positive integer number (the
00057    descriptor of a newly created external channel), or -1 on failure.
00058
```

```

00059     After the command is started, it becomes a _current_ opened external
00060     channel. The buffer can be sent to its stdin by a function
00061     int writeBufToExtChannel(buf, n)
00062     (here buf is a pointer to the buffer, n is the length in bytes; the
00063     function returns 0 in success, or -1 on failure),
00064     or one character can be read from its stdout by
00065     means of the function
00066     int getcFromExtChannel().
00067
00068     The latter returns the
00069     character casted to integer, or something <0. This can be -2 (if there
00070     is no current external channel) or EOF, if the external program closes
00071     its stdout, or if the external program outputs a string coinciding
00072     with a _terminator_.
00073
00074     By default, the terminator if an empty line. For the current external
00075     channel it can be set by means of the function
00076     int setTerminatorForExternalChannel(newterminator).
00077     The function returns 0 in success, or !0 if something is wrong (no
00078     current channel, too long terminator).
00079
00080     After getcFromExtChannel() returns EOF, the current channel becomes
00081     undefined. Any further attempts to read information by
00082     getcFromExtChannel() result in -2. To set (re-set) a current channel,
00083     the function
00084     int selectExternalChannel(n)
00085     can be used. This function accepts the valid external channel
00086     descriptor (returned by openExternalChannel) and returns the
00087     descriptor of a previous current channel (0, if there was no current
00088     channel, or -1, if the external channel descriptor is invalid).
00089     If n == 0, the function undefine the current external channel.
00090
00091     The function
00092     int closeExternalChannel(n)
00093     destroys the opened external channel with the descriptor n. It returns
00094     0 in success, or -1 on failure. If the corresponding external channel
00095     was the current one, the current channel becomes undefined. If n==0,
00096     the function closes the current external channel.
00097
00098     The function
00099     int getCurrentExternalChannel(void)
00100     returns the descriptor if the current external channel, or 0 , if
00101     there is no current external channel.
00102
00103     The function
00104     void closeAllExternalChannels(void)
00105
00106     destroys all opened external channels.
00107
00108     List of all public functions:
00109     int openExternalChannel(UBYTE *cmd,int daemonize,UBYTE *shellname, UBYTE * stderrname);
00110     int initPresetExternalChannels(UBYTE *theline, int thetimeout);
00111     int setTerminatorForExternalChannel(char *newterminator);
00112     int setKillModeForExternalChannel(int signum, int sentToWholeGroup);
00113     int closeExternalChannel(int n);
00114     int selectExternalChannel(int n);
00115     int writeBufToExtChannel(char *buf,int n);
00116     int getcFromExtChannel(void);
00117     int getCurrentExternalChannel(void);
00118     void closeAllExternalChannels(void);
00119
00120     ATTENTION!
00121
00122     Four of them:
00123     1 setTerminatorForExternalChannel
00124     2 setKillModeForExternalChannel
00125     3 writeBufToExtChannel
00126     4 getcFromExtChannel
00127
00128     are NOT functions, but variables (pointers) of a corrsponding type.
00129     They are initialised by proper values to avoid repeated error checking.
00130
00131     All public functions are independent of realization hidden in this module.
00132     All other functions may have a returned type/parameters type local w.r.t.
00133     this module; they are not declared outside of this file.

00411 This routine tests for a factor in an active or hidden expression.
00412
00413 The factor from the last call is stored in a cache.
00414 Main problem here is whether the cache is global or private to each thread.
00415 A global cache gives most likely the same traffic jam for the computation
00416 as a local cache. The local cache may stay valid longer.

```

```

00417      In the future we may make it such that threads can look at the cache
00418      of the others, or even whether a certain factor is under construction.

4.37.1 Detailed Description

Pattern matching of symbols and dotproducts. There are various routines because of the options in the id-statements like once, only, multi and many. These are among the oldest routines in FORM and that can be noticed, because the interplay with the function matching is not complete. When we match functions and halfway we fail we can backtrack properly. With the symbols, the dotproducts and the vectors (in [pattern.c](#)) there is no proper backtracking. Hence the routines here need still quite some work or may even have to be rewritten.

4.37.2 Function Documentation

4.37.2.1 FindOnly()

```
int FindOnly (
    PHEAD WORD * term,
    WORD * pattern )
```

Definition at line 61 of file [findpat.c](#).

4.37.2.2 FindOnce()

```
int FindOnce (
    PHEAD WORD * term,
    WORD * pattern )
```

Definition at line 419 of file [findpat.c](#).

4.37.2.3 FindMulti()

```
WORD FindMulti (
    PHEAD WORD * term,
    WORD * pattern )
```

Definition at line 954 of file [findpat.c](#).

4.37.2.4 FindRest()

```
int FindRest (
    PHEAD WORD * term,
    WORD * pattern )
```

Definition at line 1070 of file [findpat.c](#).

00049
00050     The current version doesn't scan function arguments yet. 10-Apr-1988
00051
00052     This routine searches for an exact match. This means in particular:
00053     1:  x^# must match exactly.
00054     2:  x^n? must have a single value for n that cannot be adapted.
00055
00056     When setp != 0 it points to a collection of sets
00057     A match can occur only if no object will be left that belongs
00058     to any of these sets.

4.41.1 Detailed Description

Prototypes for functions in [flintinterface.cc](#)

Definition in file [flintinterface.h](#).

4.41.2 Typedef Documentation

4.41.2.1 var_map_t

```
typedef std::map<uint32_t,uint32_t> flint::var_map_t
```

Definition at line 76 of file [flintinterface.h](#).

4.41.3 Function Documentation

4.41.3.1 `cleanup()`

```
void flint::cleanup (
    void )
```

Definition at line 76 of file [flintinterface.cc](#).

4.41.3.2 `cleanup_master()`

```
void flint::cleanup_master (
    void )
```

Definition at line 83 of file [flintinterface.cc](#).

4.41.3.3 `divmod_mpoly()`

```
WORD * flint::divmod_mpoly (
    PHEAD const WORD * a,
    const WORD * b,
    const bool return_rem,
    const WORD must_fit_term,
    const var_map_t & var_map )
```

Definition at line 91 of file [flintinterface.cc](#).

4.41.3.4 `divmod_poly()`

```
WORD * flint::divmod_poly (
    PHEAD const WORD * a,
    const WORD * b,
    const bool return_rem,
    const WORD must_fit_term,
    const var_map_t & var_map )
```

Definition at line 161 of file [flintinterface.cc](#).

4.41.3.5 `factorize_mpoly()`

```
WORD * flint::factorize_mpoly (
    PHEAD const WORD * argin,
    WORD * argout,
    const bool with_arghead,
    const bool is_fun_arg,
    const var_map_t & var_map )
```

Definition at line 235 of file [flintinterface.cc](#).

4.41.3.6 factorize_poly()

```
WORD * flint::factorize_poly (
    PHEAD const WORD * argin,
    WORD * argout,
    const bool with_arghead,
    const bool is_fun_arg,
    const var_map_t & var_map )
```

Definition at line 383 of file [flintinterface.cc](#).

4.41.3.7 form_sort()

```
void flint::form_sort (
    PHEAD WORD * terms )
```

Definition at line 456 of file [flintinterface.cc](#).

4.41.3.8 from_argument_mpoly()

```
uint64_t flint::from_argument_mpoly (
    fmpz_mpoly_t poly,
    fmpz_mpoly_t denpoly,
    const WORD * args,
    const bool with_arghead,
    const var_map_t & var_map,
    const fmpz_mpoly_ctx_t ctx )
```

Definition at line 511 of file [flintinterface.cc](#).

4.41.3.9 from_argument_poly()

```
uint64_t flint::from_argument_poly (
    fmpz_poly_t poly,
    fmpz_poly_t denpoly,
    const WORD * args,
    const bool with_arghead )
```

Definition at line 654 of file [flintinterface.cc](#).

4.41.3.10 fmpz_get_form()

```
WORD flint::fmpz_get_form (
    fmpz_t z,
    WORD * a )
```

Definition at line 784 of file [flintinterface.cc](#).

4.41.3.11 fmpz_set_form()

```
void flint::fmpz_set_form (
    fmpz_t z,
    UWORD * a,
    WORD na )
```

Definition at line 849 of file [flintinterface.cc](#).

4.41.3.12 gcd_mpoly()

```
WORD * flint::gcd_mpoly (
    PHEAD const WORD * a,
    const WORD * b,
    const WORD must_fit_term,
    const var_map_t & var_map )
```

Definition at line 915 of file [flintinterface.cc](#).

4.41.3.13 gcd_poly()

```
WORD * flint::gcd_poly (
    PHEAD const WORD * a,
    const WORD * b,
    const WORD must_fit_term,
    const var_map_t & var_map )
```

Definition at line 1011 of file [flintinterface.cc](#).

4.41.3.14 get_variables()

```
flint::var_map_t flint::get_variables (
    const vector< WORD * > & es,
    const bool with_arghead,
    const bool sort_vars )
```

Definition at line 1093 of file [flintinterface.cc](#).

4.41.3.15 inverse_poly()

```
WORD * flint::inverse_poly (
    PHEAD const WORD * a,
    const WORD * b,
    const var_map_t & var_map )
```

Definition at line 1210 of file [flintinterface.cc](#).

4.41.3.16 mul_mpoly()

```
WORD * flint::mul_mpoly (
    PHEAD const WORD * a,
    const WORD * b,
    const var_map_t & var_map )
```

Definition at line 1286 of file [flintinterface.cc](#).

4.41.3.17 mul_poly()

```
WORD * flint::mul_poly (
    PHEAD const WORD * a,
    const WORD * b,
    const var_map_t & var_map )
```

Definition at line 1338 of file [flintinterface.cc](#).

4.41.3.18 ratfun_add_mpoly()

```
void flint::ratfun_add_mpoly (
    PHEAD const WORD * t1,
    const WORD * t2,
    WORD * out,
    const var_map_t & var_map )
```

Definition at line 1389 of file [flintinterface.cc](#).

4.41.3.19 ratfun_add_poly()

```
void flint::ratfun_add_poly (
    PHEAD const WORD * t1,
    const WORD * t2,
    WORD * out,
    const var_map_t & var_map )
```

Definition at line 1441 of file [flintinterface.cc](#).

4.41.3.20 ratfun_normalize_mpoly()

```
void flint::ratfun_normalize_mpoly (
    PHEAD WORD * term,
    const var_map_t & var_map )
```

Definition at line 1494 of file [flintinterface.cc](#).

4.41.3.21 `ratfun_normalize_poly()`

```
void flint::ratfun_normalize_poly (
    PHEAD WORD * term,
    const var_map_t & var_map )
```

Definition at line 1577 of file [flintinterface.cc](#).

4.41.3.22 `ratfun_read_mpoly()`

```
void flint::ratfun_read_mpoly (
    const WORD * a,
    fmpz_mpoly_t num,
    fmpz_mpoly_t den,
    const var_map_t & var_map,
    fmpz_mpoly_ctx_t ctx )
```

Definition at line 1660 of file [flintinterface.cc](#).

4.41.3.23 `ratfun_read_poly()`

```
void flint::ratfun_read_poly (
    const WORD * a,
    fmpz_poly_t num,
    fmpz_poly_t den )
```

Definition at line 1718 of file [flintinterface.cc](#).

4.41.3.24 `to_argument_mpoly()` [1/2]

```
uint64_t flint::to_argument_mpoly (
    PHEAD WORD * out,
    const bool with_arghead,
    const bool must_fit_term,
    const bool write,
    const uint64_t prev_size,
    const fmpz_mpoly_t poly,
    const var_map_t & var_map,
    const fmpz_mpoly_ctx_t ctx )
```

Definition at line 1976 of file [flintinterface.cc](#).

4.41.3.25 `to_argument_mpoly()` [2/2]

```
uint64_t flint::to_argument_mpoly (
    PHEAD WORD * out,
    const bool with_arghead,
    const bool must_fit_term,
    const bool write,
    const uint64_t prev_size,
    const fmpz_mpoly_t poly,
    const var_map_t & var_map,
    const fmpz_mpoly_ctx_t ctx,
    const fmpz_t denscale )
```

Definition at line 1780 of file [flintinterface.cc](#).

4.41.3.26 to_argument_poly() [1/2]

```
uint64_t flint::to_argument_poly (
    PHEAD WORD * out,
    const bool with_arghead,
    const bool must_fit_term,
    const bool write,
    const uint64_t prev_size,
    const fmpz_poly_t poly,
    const var_map_t & var_map )
```

Definition at line 2167 of file [flintinterface.cc](#).

4.41.3.27 to_argument_poly() [2/2]

```
uint64_t flint::to_argument_poly (
    PHEAD WORD * out,
    const bool with_arghead,

4.43.1 Detailed Description

Contains functions to call FLINT interface from the rest of FORM.

Definition in file [flintwrap.cc](#).

4.43.2 Function Documentation

4.43.2.1 flint_final_cleanup_thread()

```
void flint_final_cleanup_thread (
    void )
```

Definition at line 43 of file [flintwrap.cc](#).

4.43.2.2 flint_final_cleanup_master()

```
void flint_final_cleanup_master (
    void )
```

Definition at line 50 of file [flintwrap.cc](#).

4.43.2.3 flint_div()

```
WORD * flint_div (
    PHEAD WORD * a,
    WORD * b,
    const WORD must_fit_term )
```

Definition at line 57 of file [flintwrap.cc](#).

4.43.2.4 flint_factorize_argument()

```
int flint_factorize_argument (
    PHEAD WORD * argin,
    WORD * argout )
```

Definition at line 79 of file [flintwrap.cc](#).

4.43.2.5 flint_factorize_dollar()

```
WORD * flint_factorize_dollar (
    PHEAD WORD * argin )
```

Definition at line 100 of file [flintwrap.cc](#).

4.43.2.6 flint_gcd()

```
WORD * flint_gcd (
    PHEAD WORD * a,
    WORD * b,
    const WORD must_fit_term )
```

Definition at line 119 of file [flintwrap.cc](#).

4.43.2.7 flint_inverse()

```
WORD * flint_inverse (
    PHEAD WORD * a,
    WORD * b )
```

Definition at line 140 of file [flintwrap.cc](#).

4.43.2.8 flint_mul()

```
WORD * flint_mul (
    PHEAD WORD * a,
    WORD * b )
```

Definition at line 161 of file [flintwrap.cc](#).

4.43.2.9 flint_ratfun_add()

```
WORD * flint_ratfun_add (
    PHEAD WORD * t1,
    WORD * t2 )
```

Definition at line 180 of file [flintwrap.cc](#).

4.43.2.10 flint_ratfun_normalize()

```
int flint_ratfun_normalize (
    PHEAD WORD * term )
```

Definition at line 219 of file [flintwrap.cc](#).

4.43.2.11 flint_rem()

```
WORD * flint_rem (
    PHEAD WORD * a,
    WORD * b,
    const WORD must_fit_term )
```

Definition at line 292 of file [flintwrap.cc](#).

4.43.2.12 flint_check_version()

```
void flint_check_version (
    void )
```

Checks the FLINT library version at runtime.

This function should be called at startup. The program will terminate if a known buggy version of FLINT is detected.

Definition at line 321 of file [flintwrap.cc](#).

4.44 flintwrap.cc

4.45.1 Detailed Description

This file contains numerical routines that deal with floating point numbers. We use the GMP for arbitrary precision floating point arithmetic. The functions of the type sin, cos, ln, sqrt etc are handled by the mpfr library. The reason that for MZV's and the general notation we use the GMP (mpf_) is because the contents of the structs have been frozen and can be used for storage in a Form function float_. With mpfr_ this is not safely possible. All mpfr_ related code is in the file [evaluate.c](#).

Definition in file [float.c](#).

4.45.2 Macro Definition Documentation

4.45.2.1 WITHCUTOFF

```
#define WITHCUTOFF
```

Definition at line 45 of file [float.c](#).

4.45.2.2 GMPSPREAD

```
#define GMPSPREAD (GMP_LIMB_BITS/BITSINWORD)
```

Definition at line 47 of file [float.c](#).

4.45.3 Function Documentation

4.45.3.1 Form_mpf_init()

```
void Form_mpf_init (  
    mpf_t t )
```

Definition at line 177 of file [float.c](#).

4.45.3.2 Form_mpf_clear()

```
void Form_mpf_clear (  
    mpf_t t )
```

Definition at line 201 of file [float.c](#).

4.45.3.3 Form_mpf_set_prec_raw()

```
void Form_mpf_set_prec_raw (  
    mpf_t t,  
    ULONG newprec )
```

Definition at line 227 of file [float.c](#).

4.45.3.4 FormtoZ()

```
void FormtoZ (  
    mpz_t z,  
    UWORD * a,  
    WORD na )
```

Definition at line 513 of file [float.c](#).

4.45.3.5 ZtoForm()

```
void ZtoForm (  
    UWORD * a,  
    WORD * na,  
    mpz_t z )
```

Definition at line 557 of file [float.c](#).

4.45.3.6 FloatToInteger()

```
long FloatToInteger (
    UWORD * out,
    mpf_t floatin,
    long * bitsused )
```

Definition at line 583 of file [float.c](#).

4.45.3.7 IntegerToFloat()

```
void IntegerToFloat (
    mpf_t result,
    UWORD * formlong,
    int longsize )
```

Definition at line 606 of file [float.c](#).

4.45.3.8 FloatToRat()

```
int FloatToRat (
    UWORD * ratout,
    WORD * nratout,
    mpf_t floatin )
```

Definition at line 670 of file [float.c](#).

4.45.3.9 AddFloats()

```
int AddFloats (
    PHEAD WORD * fun3,
    WORD * fun1,
    WORD * fun2 )
```

Definition at line 988 of file [float.c](#).

4.45.3.10 MulFloats()

```
int MulFloats (
    PHEAD WORD * fun3,
    WORD * fun1,
    WORD * fun2 )
```

Definition at line 1004 of file [float.c](#).

4.45.3.11 DivFloats()

```
int DivFloats (
    PHEAD WORD * fun3,
    WORD * fun1,
    WORD * fun2 )
```

Definition at line 1020 of file [float.c](#).

4.45.3.12 AddRatToFloat()

```
int AddRatToFloat (
    PHEAD WORD * outfun,
    WORD * infun,
    UWORD * formrat,
    WORD nrat )
```

Definition at line [1038](#) of file [float.c](#).

4.45.3.13 MulRatToFloat()

```
int MulRatToFloat (
    PHEAD WORD * outfun,
    WORD * infun,
    UWORD * formrat,
    WORD nrat )
```

Definition at line [1057](#) of file [float.c](#).

4.45.3.14 SimpleDelta()

```
void SimpleDelta (
    mpf_t sum,
    int m )
```

Definition at line [1869](#) of file [float.c](#).

4.45.3.15 SimpleDeltaC()

```
void SimpleDeltaC (
    mpf_t sum,
    int m )
```

Definition at line [1928](#) of file [float.c](#).

4.45.3.16 SingleTable()

```
void SingleTable (
    mpf_t * tabl,
    int N,
    int m,
    int pow )
```

Definition at line [1987](#) of file [float.c](#).

4.45.3.17 DoubleTable()

```
void DoubleTable (
    mpf_t * tabout,
    mpf_t * tabin,
    int N,
    int m,
    int pow )
```

Definition at line 2039 of file [float.c](#).

4.45.3.18 EndTable()

```
void EndTable (
    mpf_t sum,
    mpf_t * tabin,
    int N,
    int m,
    int pow )
```

Definition at line 2090 of file [float.c](#).

4.45.3.19 deltaMZV()

```
void deltaMZV (
    mpf_t result,
    WORD * indexes,
    int depth )
```

Definition at line 2135 of file [float.c](#).

4.45.3.20 deltaEuler()

```
void deltaEuler (
    mpf_t result,
    WORD * indexes,
    int depth )
```

Definition at line 2202 of file [float.c](#).

4.45.3.21 deltaEulerC()

```
void deltaEulerC (
    mpf_t result,
    WORD * indexes,
    int depth )
```

Definition at line 2258 of file [float.c](#).

4.45.3.22 CalculateMZVhalf()

```
void CalculateMZVhalf (
    mpf_t result,
    WORD * indexes,
    int depth )
```

Definition at line [2331](#) of file [float.c](#).

4.45.3.23 CalculateMZV()

```
void CalculateMZV (
    mpf_t result,
    WORD * indexes,
    int depth )
```

Definition at line [2352](#) of file [float.c](#).

4.45.3.24 CalculateEuler()

```
void CalculateEuler (
    mpf_t result,
    WORD * Zindexes,
    int depth )
```

Definition at line [2417](#) of file [float.c](#).

4.45.3.25 ExpandMZV()

```
int ExpandMZV (
    WORD * term,
    WORD level )
```

Definition at line [2493](#) of file [float.c](#).

4.45.3.26 ExpandEuler()

```
int ExpandEuler (
    WORD * term,
    WORD level )
```

Definition at line [2505](#) of file [float.c](#).

4.45.3.27 PackFloat()

```
int PackFloat (
    WORD * fun,
    mpf_t infloat )
```

Definition at line [271](#) of file [float.c](#).

4.45.3.28 UnpackFloat()

```
int UnpackFloat (
    mpf_t outfloat,
    WORD * fun )
```

Definition at line 366 of file [float.c](#).

4.45.3.29 RatToFloat()

```
void RatToFloat (
    mpf_t result,
    UWORD * format,

00080 /*
00081 *   #[] Includes :
00082 *   #[] Some GMP float info :
00083 *
00084 *   From gmp.h:
00085 *
00086 *   typedef struct
00087 *   {
00088 *       int _mp_prec;           Max precision, in number of `mp_limb_t's.
00089 *                               Set by mpf_init and modified by
00090 *                               mpf_set_prec. The area pointed to by the
00091 *                               _mp_d field contains `prec' + 1 limbs.

```

```

00092     int _mp_size;      abs(_mp_size) is the number of limbs the
00093                        last field points to. If _mp_size is
00094                        negative this is a negative number.
00095     mp_exp_t _mp_exp; Exponent, in the base of 'mp_limb_t'.
00096     mp_limb_t *_mp_d; Pointer to the limbs.
00097 } __mpf_struct;
00098
00099 typedef __mpf_struct mpf_t[1];
00100
00101 Currently:
00102     sizeof(int) = 4
00103     sizeof(mpf_t) = 24
00104     sizeof(mp_limb_t) = 8,
00105     sizeof(mp_exp_t) = 8,
00106     sizeof a pointer is 8.
00107 If any of this changes in the future we would have to change the
00108 PackFloat and UnpackFloat routines.
00109
00110 Our float_ function is packed with the 4 arguments:
00111     -SNUMBER _mp_prec
00112     -SNUMBER _mp_size
00113     exponent which can be -SNUMBER or a regular term
00114     the limbs as n/1 in regular term format, or just an -SNUMBER.
00115 During normalization the sign is taken away from the second argument
00116 and put as the sign of the complete term. This is easier for the
00117 WriteInnerTerm routine in sch.c
00118
00119 Wildcarding of functions excludes matches with float_
00120 Float_ always ends up inside the bracket, just like poly(rat)fun.
00121
00122 From mpfr.h
00123
00124 The formats here are different. This has, among others, to do with
00125 the rounding. The result is that we need different aux variables
00126 when working with mpfr and we need a different conversion routine
00127 to float. It also means that we need to treat the mvz_ etc functions
00128 completely separately. For now we try to develop that in the file
00129 Evaluate.c. At a later stage we may merge the two files.
00130 Originally we had the sqrt in float.c but it seems better to put
00131 it in Evaluate.c
00132
00133 #] Some GMP float info :
00134 #[ Low Level :
00135
00136     In the low level routines we interact directly with the content
00137     of the GMP structs. This can be done safely, because their
00138     layout is documented. We pay particular attention to the init
00139     and clear routines, because they involve malloc/free calls.
00140
00141     #[ Explanations :
00142
00143     We need a number of facilities inside Form to deal with floating point
00144     numbers, taking into account that they are only meant for sporadic use.
00145     1: We need a special function float_ who's arguments contain a limb
00146     representation of the mpf_t of the gmp.
00147     2: Some functions may return a floating point number. This is then in
00148     the form of an occurrence of the function float_.
00149     3: We need a print routine to print this float_.
00150     4: We need routines for conversions:
00151         a: (long) int to float.
00152         b: rat to float.
00153         c: float to rat (if possible)
00154         d: float to integer (with rounding toward zero).
00155     5: We need calculational operations for add, sub, mul, div, exp.
00156     6: We need service routines to pack and unpack the function float_.
00157     7: The coefficient should be pulled inside float_.
00158     8: Float_ cannot occur inside PolyRatFun.
00159     9: We need to be able to treat float_ as the coefficient during sorting.
00160     10: For now, we need the functions mvzf_ and eulerf_ for the evaluation
00161     of mvz's and euler sums.
00162     11: We need a setting for the default precision.
00163     12: We need a special flag for the dirty field of arguments to avoid
00164     the normalization of the argument with the limbs.
00165     Alternatively, the float_ should be not a regular function, but
00166     get a status < FUNCTION. Just like SNUMBER, LNUMBER etc.
00167
00168     Note that we can keep this thread-safe. The only routine that is not
00169     thread-safe is the print routine, but that is in accordance with all
00170     other print routines in Form. When called from MesPrint it needs to
00171     be protected by a lock, as is done standard inside Form.
00172

00250
00251 /*
00252     #] Form_mpf_set_prec_raw :
00253     #[ PackFloat :
00254
00255     Puts an object of type mpf_t inside a function float_
00256     float_(prec, nlimbs, exp, limbs);
00257     Complication: the limbs and the exponent are long's. That means
00258     two times the size of a Form (U)WORD.
00259     To save space we could split the limbs in two because Form stores
00260     coefficients as rationals with equal space for numerator and denominator.
00261     Hence for each limb we could put the most significant UWORD in the
00262     numerator and the least significant limb in the denominator.
00263     This gives a problem with the compilation and subsequent potential
00264     normalization of the 'fraction'. Hence for now we take the wasteful
00265     approach. At a later stage we can try to veto normalization of FLOATFUN.

```

```

00266     Caution: gmp/fmp is little endian and Form is big endian.

01600 /*
01601     #] Chop :
01602     #] Float Routines :
01603     #[ Sorting :
01604
01605     We need a method to see whether two terms need addition that could
01606     involve floating point numbers.
01607     1: if PolyWise is active, we do not need anything, because
01608         Poly(Rat)Fun and floating point are mutually exclusive.
01609     2: This means that there should be only interference in AddCoef.
01610         and the AddRat parts in MergePatches, MasterMerge, SortBotMerge
01611         and PF_GetLoser.
01612     The compare routine(s) should recognise the float_ and give off
01613     a code (SortFloatMode) inside the AT struct:
01614     0: no float_
01615     1: float_ in term1 only
01616     2: float_ in term2 only
01617     3: float_ in both terms
01618     Be careful: we have several compare routines, because various codes
01619     use their own routines and we just set a variable with its address.
01620     Currently we have Compare1, CompareSymbols and CompareHSymbols.
01621     Only Compare1 should be active for this. The others should make sure
01622     that the proper variable is always zero.
01623     Remember: the sign of the coefficient is in the last word of the term.
01624
01625     We need two routines:
01626     1: AddWithFloat for SplitMerge which sorts by pointer.
01627     2: MergeWithFloat for MergePatches etc which keeps terms as much
01628         as possible in their location.
01629     The routines start out the same, because AT.SortFloatMode, set in
01630     Compare1, tells more or less what should be done.
01631     The difference is in where we leave the result.
01632
01633     In the future we may want to add a feature that makes the result
01634     zero if the sum comes within a certain distance of the numerical
01635     accuracy, like for instance 5% of the number of bits.
01636

02395 /*
02396     #] CalculateMZV :
02397     #[ CalculateEuler :
02398
02399     There is a problem of notation here.
02400     Basically there are two notations.
02401     1:  $Z(m_1,m_2,m_3) = \sum_{j_3=1}^{\infty} \text{sign}_{-}(m_3) / j_3^{\text{abs}_{-}(m_3)} * \sum_{j_2=1}^{\infty} \text{sign}_{-}(m_2) / j_2^{\text{abs}_{-}(m_2)} * \sum_{j_1=1}^{\infty} \text{sign}_{-}(m_1) / j_1^{\text{abs}_{-}(m_1)}$ 
02402
02403     See Broadhurst,1996
02404     2:  $L(m_1,m_2,m_3) = \sum_{j_1=1}^{\infty} \text{sign}_{-}(m_1) * \sum_{j_2=1}^{\infty} \text{sign}_{-}(m_2) * \sum_{j_3=1}^{\infty} \text{sign}_{-}(m_3) / j_3^{\text{abs}_{-}(m_3)} / (j_2+j_3)^{\text{abs}_{-}(m_2)} / (j_1+j_2+j_3)^{\text{abs}_{-}(m_1)}$ 
02405
02406     See Borwein, Bradley, Broadhurst and Lisonek, 1999
02407     The L corresponds with the H of the datamine up to  $\text{sign}_{-}(m_1*m_2*m_3)$ 
02408     The algorithm follows 2, but the more common notation is 1.
02409     Hence we start with a conversion.

02513     #] ExpandEuler :
02514     #[ EvaluateEuler :
02515
02516     There are various steps here:
02517     1: locate an Euler function.
02518     2: evaluate it into a float.
02519     3: convert the coefficient to a float and multiply.
02520     4: Put the new term together.
02521     5: Restart to see whether there are more Euler functions.
02522     The compiler should check that there is no conflict between
02523     the evaluate command and a potential polyfun or polyratfun.
02524     Yet, when reading in expressions there can be a conflict.
02525     Hence the Normalize routine should check as well.

- typedef int(* [TFUN1](#)) (UBYTE *, int)

4.51.1 Detailed Description

Contains the definitions of many internal codes Rather than using numbers directly we do this by defines, making it much easier to change things. Changing things is sometimes also a good way of testing the code.

Definition in file [ftypes.h](#).

4.51.2 Macro Definition Documentation

4.51.2.1 WITHOUTERROR

```
#define WITHOUTERROR 0
```

The next macros were introduced when TFORM was programmed. In the case of workers, each worker may need some private data. These can in principle be accessed by some posix calls but that is unnecessarily slow. The passing of a pointer to the complete data struct with private data will be much faster. And anyway, there would have to be a macro that either makes the posix call (TFORM) or doesn't (FORM). The solution by having macro's that either pass the pointer (TFORM) or don't pass it (FORM) is seen as the best solution.

In the declarations and the calling of the functions we have to use the PHEAD or the BHEAD macro, respectively, if the pointer is to be passed. These macro's contain the comma as well. Hence we need special macro's if there are no other arguments. These are called PHEAD0 and BHEAD0.

4.53.1 Detailed Description

The file with the central routines for the pattern matching of functions and their arguments. The file also contains the routines for the execution of the Symmetrize statement and its variations (like antisymmetrize etc).

Definition in file [function.c](#).

4.53.2 Function Documentation

4.53.2.1 MakeDirty()

```
int MakeDirty (
    WORD * term,
    WORD * x,
    WORD par )
```

Definition at line 51 of file [function.c](#).

4.53.2.2 MarkDirty()

```
void MarkDirty (
    WORD * term,
    WORD flags )
```

Definition at line 97 of file [function.c](#).

4.53.2.3 PolyFunDirty()

```
void PolyFunDirty (
    PHEAD WORD * term )
```

Definition at line 139 of file [function.c](#).

4.53.2.4 PolyFunClean()

```
void PolyFunClean (
    PHEAD WORD * term )
```

Definition at line 174 of file [function.c](#).

4.53.2.5 Symmetrize()

```
WORD Symmetrize (
    PHEAD WORD * func,
    WORD * Lijst,
    WORD ngroups,
    WORD gsize,
    WORD type )
```

Definition at line 213 of file [function.c](#).

4.53.2.6 CompGroup()

```
int CompGroup (
    PHEAD WORD type,
    WORD ** args,
    WORD * a1,
    WORD * a2,
    WORD num )
```

Definition at line 373 of file [function.c](#).

4.53.2.7 FullSymmetrize()

```
int FullSymmetrize (
    PHEAD WORD * fun,
    int type )
```

Definition at line 473 of file [function.c](#).

4.53.2.8 SymGen()

```
int SymGen (
    PHEAD WORD * term,
    WORD * params,
    WORD num,
    WORD level )
```

Definition at line 518 of file [function.c](#).

4.53.2.9 SymFind()

```
int SymFind (
    PHEAD WORD * term,
    WORD * params )
```

Definition at line 633 of file [function.c](#).

4.53.2.10 ChainIn()

```
int ChainIn (
    PHEAD WORD * term,
    WORD funnum )
```

Definition at line 691 of file [function.c](#).

4.53.2.11 ChainOut()

```
int ChainOut (
    PHEAD WORD * term,
    WORD funnum )
```

Definition at line 748 of file [function.c](#).

4.53.2.12 MatchFunction()

```
int MatchFunction (
    PHEAD WORD * pattern,
    WORD * interm,
    WORD * wilds )
```

Definition at line 826 of file [function.c](#).

4.53.2.13 ScanFunctions()

```
int ScanFunctions (
    PHEAD WORD * inpat,
    WORD * inter,
    WORD par )
```

Definition at line 1618 of file [function.c](#).

4.54 function.c

00801 /*
00802     #] ChainOut :
00803     #] Utilities :
00804     #[ Patterns :
00805         #[ MatchFunction :          WORD MatchFunction(pattern,interm,wilds)
00806
00807         The routine assumes that the function numbers are the same.
00808         The contents are compared and a possible wildcard assignment
00809         is made. Note that it may be necessary to use a wildcard
00810         assignment stack to do things right.
00811         The routine can become arbitrarily complicated as there is
00812         no end to the possible wilddarding.
00813         Examples:
00814         - a: No wilddarding -> straight match
00815         - b: Individual arguments (object -> object)
00816         - c: whole arguments (object to subexpression)
00817         - d: any argumentlist
00818         - e: part of an argument (object inside subexpression)
00819
00820         The ones with a minus sign in front have been implemented.
00821
00822         Note: the argument wilds allows backtracking when multiple
00823         ?a,?b give a match that later turns out to be useless.

01575     #] MatchFunction :
01576     #[ ScanFunctions :          WORD ScanFunctions(inpat,inter,par)
01577
01578     Finds in which functions to look for a match.
01579     inpat is the start of the pattern still to be matched.
01580     inter is the start of the term still to be matched.
01581     par gives information about commutativity.
01582         par = 0: nothing special
01583         par = 1: regular noncommuting function
01584         par = 2: GAMMA function
01585
01586     AN.patstop: end of the functions field in the search pattern
01587     AN.terstop: end of the functions field in the target pattern
01588     AN.terstart: address of entire term;
01589
01590     The actual matching of the functions and their arguments is done
01591     in a number of different routines. Mainly MatchFunction when there
01592     are no symmetry properties.
01593     Also: MatchE
01594           MatchCy
01595           FunMatchSy
01596           FunMatchCy
01597
01598     The main problem here is backtracking, ie continuing with wildcard
01599     possibilities when a first assignment doesn't work.
01600     Important note: this was completely forgotten in the symmetric
01601     functions till 6-jan-2009. As of the moment this still has to
01602     be fixed.  ?????21-mar-2023????? Is this still unfixed?????
01603
01604     Functions inside functions can cause problems when antisymmetric
01605     functions are involved. The sign of the term may be at stake.
01606     At the lowest level this is no problem but in f(-fas(n2,n1)) this
01607     plays a role. Next is when we have a product of functions inside
01608     an argument. The strategy must be that we test the sign only at the
01609     last function. Hence, when inpat+inpat[1] >= AN.patstop.
01610     We might relax that to the last antisymmetric function at a later stage.
01611
01612     New scheme to be implemented for non-commuting objects:
01613     When we are matching a second (or higher) function, any match can only
01614     be directly after the last matched non-commuting function or a commuting
01615     function. This will take care of whatever happens in MatchE etc.

4.60.1 Detailed Description

Routines for the dealing with if statements.

Definition in file [if.c](#).

4.60.2 Function Documentation

4.60.2.1 GetIfDollarNum()

```
WORD GetIfDollarNum (
    WORD * ifp,
    WORD * ifstop )
```

Definition at line 106 of file [if.c](#).

4.60.2.2 FindVar()

```
int FindVar (
    WORD * v,
    WORD * term )
```

Definition at line 173 of file [if.c](#).

4.60.2.3 DolfStatement()

```
int DoIfStatement (
    PHEAD WORD * ifcode,
    WORD * term )
```

Definition at line 280 of file [if.c](#).

4.60.2.4 HowMany()

```
WORD HowMany (
    PHEAD WORD * ifcode,
    WORD * term )
```

Definition at line 840 of file [if.c](#).

4.60.2.5 DoubleIfBuffers()

```
void DoubleIfBuffers (
    void )
```

Definition at line 1033 of file [if.c](#).

4.60.2.6 DoSwitch()

```
int DoSwitch (
    PHEAD WORD * term,
    WORD * lhs )
```

Definition at line 1070 of file [if.c](#).

4.60.2.7 DoEndSwitch()

```
int DoEndSwitch (
    PHEAD WORD * term,
    WORD * lhs )
```

Definition at line 1086 of file [if.c](#).

4.60.2.8 FindCase()

```
SWITCHTABLE * FindCase (
    WORD nswitch,
    WORD ncase )
```

Definition at line 1097 of file [if.c](#).

4.60.2.9 DoubleSwitchBuffers()

```
int DoubleSwitchBuffers (
    void )
```

Definition at line 1135 of file [if.c](#).

4.60.2.10 SwitchSplitMergeRec()

```
void SwitchSplitMergeRec (
    SWITCHTABLE * array,
    WORD num,
    SWITCHTABLE * auxarray )
```

Definition at line 1184 of file [if.c](#).

4.60.2.11 SwitchSplitMerge()

```
void SwitchSplitMerge (
    SWITCHTABLE * array,
    WORD num )
```

Definition at line 1213 of file [if.c](#).

00030 /* #[ License : */
00031 /*
00032     #[ Includes : if.c
00033 */
00034 #include "form3.h"
00035
00036
00037 /*
00038     #[ Includes :
00039     #[ If statement :
00040         #[ Syntax :
00041
00042         The `if' is a conglomerate of statements: if,else,endif
00043
00044         The if consists in principle of:
00045
00046         if ( number );
00047             statements
00048         else;
00049             statements
00050         endif;
00051
00052         The first set is taken when number != 0.
00053         The else is not mandatory.
00054         TRUE = 1 and FALSE = 0
00055
00056         The number can be built up via a logical expression:
00057
00058             expr1 condition expr2
00059
00060         each expression can be a subexpression again. It has to be
00061         enclosed in parentheses in that case.
00062         Conditions are:
00063             >, >=, <, <=, ==, !=, ||, &&
00064
00065         When Expressions are chained evaluation is from left to right,
00066         independent of whether this indicates nonsense.
00067         if ( a || b || c || d ); is a perfectly normal statement.
00068         if ( a >= b || c == d ); would be messed up. This should be:
00069         if ( ( a >= b ) || ( c == d ) );
00070
00071         The building blocks of the Expressions are:
00072
00073             Match(option,pattern)   The number of times pattern fits in term_
00074             Count(...)              The count value of term_
00075             Coeff[icient]           The coefficient of term_
00076             FindLoop(options)       Are there loops (as in ReplaceLoop).
00077
00078         Implementation for internal notation:
00079
00080         TYPEIF,length,gotolevel(if fail),EXPRTYPE,length,.....
00081
00082         EXPRTYPE can be:
00083             SHORTNUMBER             ->,4,sign,size
00084             LONGNUMBER              ->,{ncoef+2|,ncoef,numer,denom
00085             MATCH                   ->,patternsiz+3,keyword,pattern

```

```

00086      MULTIPLEOF      ->,3,thenumber
00087      COUNT           ->,countsize+2,countinfo
00088      TYPEFINDLOOP    ->,7 (findloop info)
00089      COEFFICIENT     ->,2
00090      IFDOLLAR        ->,3,dollarnumber
00091      SUBEXPR         ->,size,dummy,size1,EXPRTYPE,length,...
00092                   ,2,condition1,size2,...
00093                   This is like functions.
00094
00095      Note that there must be a restriction to the number of nestings
00096      of parentheses in an if statement. It has been set to 10.
00097
00098      The syntax of match corresponds to the syntax of the left side
00099      of an id statement. The only difference is the keyword
00100      MATCH vs TYPEIDNEW.
00101

00042     #] Includes :
00043     #[ syntax and use :
00044
00045     The indexing of brackets is not automatic! It should only be used
00046     when one intends to use the contents of individual brackets.
00047     This is done with the addition of a + sign to the bracket statement:
00048     B+ a,b,c; or AB+ a,b,c;
00049     It does require resources! The index is kept in memory and is removed
00050     once the expression is treated and passed on to the output with different
00051     or no brackets.
00052     The index is limited to a given amount of space. Hence if there are too
00053     many brackets we will skip some in the index. Skipping goes by space
00054     occupied by the contents. We take the two adjacent bracket(s) with the
00055     least space together and represent them by the first one only. This gives
00056     a new spot.
00057     The expression struct has two pointers:
00058     bracketinfo      for using.
00059     newbracketinfo   for making new index.
00060
00061     #] syntax and use :

4.66.1 Detailed Description

Routines to find loops in index contractions. These routines allow for a category of topological statements. They were originally developed for the color library.

Definition in file [lus.c](#).

4.66.2 Function Documentation

4.66.2.1 Lus()

```
int Lus (
    WORD * term,
    WORD funnum,
    WORD loopsize,
    WORD numargs,
    WORD outfun,
    WORD mode )
```

Definition at line 57 of file [lus.c](#).

4.66.2.2 FindLus()

```
int FindLus (
    int from,
    int level,
    int openindex )
```

Definition at line [515](#) of file [lus.c](#).

4.66.2.3 SortTheList()

```
int SortTheList (
    int * slist,
    int num )
```

Definition at line [578](#) of file [lus.c](#).

4.66.2.4 AllLoops()

```
int AllLoops (
    PHEAD WORD * term,
    WORD level )
```

Definition at line [650](#) of file [lus.c](#).

4.66.2.5 StartLoops()

```
LONG StartLoops (
    PHEAD WORD * term,
    WORD level,
    LONG vert,
    WORD nvert,
    WORD * arglist,
    WORD nargs,
    WORD * loop,
    WORD nloop )
```

Definition at line [894](#) of file [lus.c](#).

4.66.2.6 GenLoops()

```
LONG GenLoops (
    PHEAD WORD * term,
    WORD level,
    LONG vert,
    WORD nvert,
    WORD * arglist,
    WORD nargs,
    WORD * loop,
    WORD nloop )
```

Definition at line [980](#) of file [lus.c](#).

4.66.2.7 LoopOutput()

```
void LoopOutput (
    PHEAD WORD * term,
    WORD level,
    WORD * loop,
    WORD nloop )
```

Definition at line [1059](#) of file [lus.c](#).

4.66.2.8 AllPaths()

```
int AllPaths (
    PHEAD WORD * term,
    WORD level )
```

Definition at line [1123](#) of file [lus.c](#).

4.66.2.9 GenPaths()

```
LONG GenPaths (
    PHEAD WORD * term,
    WORD level,
    LONG vert,
    WORD nvert,
    WORD * arglist,
    WORD nargs,
    WORD * path,
    WORD npath )
```

Definition at line [1413](#) of file [lus.c](#).

4.66.2.10 PathOutput()

```
void PathOutput (
    PHEAD WORD * term,
    WORD level,
    WORD * path,
    WORD npath )
```

Definition at line [1486](#) of file [lus.c](#).

4.66.2.11 AllOnePI()

```
WORD AllOnePI (
    WORD * term,
    WORD level )
```

Definition at line [1566](#) of file [lus.c](#).

4.66.2.12 RemoveBridges()

```
int RemoveBridges (
    void )
```

Definition at line 1586 of file [lus.c](#).

4.66.2.13 TakeOneLine()

```
int TakeOneLine (
    WORD * term,
    WORD level )
```

Definition at line 1596 of file [lus.c](#).

4.66.2.14 OutputOnePI()

```
int OutputOnePI (
    PHEAD WORD * term,
    WORD level )
```

Definition at line 1608 of file [lus.c](#).

00624 #] SortTheList :
00625 #[ AllLoops :
00626
00627 Routine finds all possible loops that can be made in the
00628 arguments of the symmetric commuting vertex function v and creates
00629 for each loop a new term which is the original term times the loop.
00630 The occurrences of v can have different numbers of arguments.
00631 Each argument that occurs twice (and in different instances of v)
00632 in total will be considered.
00633
00634 The input parameters are in C->lhs[level] and are
00635 C->lhs[level][0] TYPEALLLOOPS
00636 C->lhs[level][1] 6
00637 C->lhs[level][2] Number of function v.
00638 C->lhs[level][3] Number of the output function loop.
00639 C->lhs[level][4] option1: the type of argument.
00640 C->lhs[level][5] option2: 0,1: what to do if no loop.
00641 Eligible arguments must be of the type SYMBOL, VECTOR, INDEX or SNUMBER.
00642 They must all be of the same type, indicated by option1.
00643 Extra restriction: In a loop, each v can be visited at most once.
00644 If there is no loop at all, option2 determines whether the term
00645 remains unmodified, or is replaced by zero.
00646 Function v can be either a regular function or a tensor.
00647 To facilitate this we copy the relevant arguments into the workspace.

00837 there is no need to avoid them as potential loops.
00838
00839 At this point we are ready to look for loops.
00840 We have
00841     arglist,nargs    list of eligible objects.
00842     vert,nvert       position in pWorkSpace for vertices and their number.
00843                     The vertices themselves are in the WorkSpace.
00844     loop,nloop       The buildup of the loop.
00845 */
00846 loop = AT.WorkPointer;
00847 AT.WorkPointer += nargs;
00848 nloop = 0;
00849 numgenerated += StartLoops(BHEAD term,level,vert,nvert,arglist,nargs,loop,nloop);
00850 AT.WorkPointer = oldworkpointer;
00851 AT.pWorkPointer = oldpworkpointer;
00852
00853 if ( numgenerated == 0 && option2 != 0 ) return(Generator(BHEAD term,level));
00854 return(0);
00855 }
00856
00857 /*
00858 #] AllLoops :
00859 #[ StartLoops :
00860
00861 Algorithm.
00862 1: have a list of vertices and objects that can be part of the loops.
00863 2: starting with the first element of arglist, look for the two
00864    vertices that contain this object. The first is vstart.
00865 3: At the second, look at all possible objects to continue from here.
00866 4: For each, find the vertex with its partner.
00867 5: if the partner vertex is vstart, we have a loop. --> 9.
00868 6: The partner vertex is not allowed to be a vertex that we passed
00869    in the current build-up of the loop.
00870 7: Put the object in loop and increase nloop.
00871 8: Now sum over all allowed objects in the partner vertex. --> 4.
00872
00873 9: Create the function loop with the arguments from loop,nloop.
00874 10: If a reverse cyclic permutation gives a smaller result, drop this
00875     solution and continue with the last summing over objects at a vertex.
00876 11: If not, output the result by adding the function loop
00877     to the term and call Generator(term,level)
00878
00879 12: when all possibilities with the first element of arglist have been
00880     exhausted, raise arglist and lower nargs by one. --> 2
00881 13: when nargs == 1, we can stop.
00882
00883 The inclusion of a new object when we sum over the possibilities at a
00884 vertex can best be done in a recursion, because we have no idea how
00885 many nested loops we would otherwise need. Of course the recursion can
00886 be emulated, but that makes the algorithm rather messy.
00887
00888 We have two routines: StartLoops and GenLoops.
00889 StartLoops takes care of the first argument (and the summing over who
00890 is the first argument), while GenLoops treats an additional vertex until
00891 a loop is closed. GenLoops also sends completed loops off to Generator.

01533
01534 We assume a graph that has loops and is OnePI.
01535 This routine initializes the recursion that creates all onePI subgraphs.
01536
01537 Algorithm:
01538     a: have a routine that removes all bridges: RemoveBridges
01539     b: output an empty diagram.
01540     c: output the diagram itself
01541     d: cut a line, followed by removing all bridges.
01542     e: if the diagram still has lines, go to c, else go to the next line in d.
01543 In order to avoid factorial blowup, we need to prune the tree as fast as possible.
01544
01545 1: list of lines to be cut.
01546 2: once we have tried a line and removed its bridges, we do not have to
01547    try this line deeper in the tree, neither its bridges.
01548
01549
01550 1 2 3
01551     cut 1.                x
01552         cut 2 -> bridge 3    x
01553     cut 2.                x
01554         cut 3 -> bridge 1    ???? mag niet
01555     cut 3.                x
01556 Hence 1,2,3,4,5,6,7
01557     1 still to go 2,3,4,5,6,7
01558     2 still to go 3,4,5,6,7
01559     3 still to go 4,5,6,7
01560     etc.
01561 bridges: if x is bridge, we take x from the list_to_go.
01562 If we have a bridge that is a number lower than the list_to_go we skip this possibility.
01563 We reach the end when the list_to_go is empty.

00037 /*
00038  #] Documentation :
00039
00040 The enhanced malloc debugger. It intercepts access (both write AND
00041 read) to the memory outside the allocated chunk in the following
00042 manner: it prints out (to the stderr) the information about the event
00043 and goes to the spillock. The user is able to attach the debugger to
00044 the running process, investigate the problem and continue evaluation.
00045
00046 In case of error, the debugger will print to the stderr the following
00047 information:
00048 "***** PID: ###, Addr: ###, signal ### (code ###)"
00049 "Attach gdb -p ### and set var loopForever=0 in a corresponding frame to continue"
00050 or for TFORM:
00051 "Attach gdb -p ### and set var loopForever=0 in a corresponding frame
00052   of a thread with LPW id ### to continue"
00053
00054 and go to the spillock. The user may attach gdb by the command
00055 gdb -p ### and type "where" (in case of TFORM, the user should first
00056 switch to the proper thread). Then investigation of the corresponding
00057 frames should clarify the situation. In order to continue the program,
00058 the user might set (in the corresponding frame of the corresponding
00059 thread) the variable loopForever to 0. The debugger will try to remove
00060 local problem lead to the exception.
00061
00062 To activate the debugger, the macro MALLOCPROTECT should be
00063 defined. There are three possible values:
00064 #define MALLOCPROTECT -1 (any integer <0)
00065 #define MALLOCPROTECT 0
00066 #define MALLOCPROTECT 1 (any integer>0)
00067
00068 If MALLOCPROTECT < 0, the debugger will intercept any access to the
00069 memory before the allocated chunk, even one byte.
00070
00071 If MALLOCPROTECT == 0, the debugger will intercept any access to the
00072 memory before the allocated chunk, even one byte, and access to the
00073 memory page next to the allocated one.
00074
00075 If MALLOCPROTECT > 0, the debugger will intercept any access to the
00076 memory after the allocated chunk, even one byte, and access to the
00077 memory page before the allocated one.
00078
00079 The original FORM malloc debugger is able to catch errors when the

```

```

00080 allocated memory is freed improper, or if some small portion OUT of
00081 the allocated chunk is written. This debugger is a complementary
00082 one. It permits to catch situation when some small portion of memory
00083 before or after the allocated chunk is written or even just read.
00084
00085 The idea is to protect the beginning or the end of the allocated chunk
00086 for any kind of access and install the SIGSEGV handler in order to
00087 intercept the access to this memory. Moreover, the allocated memory is
00088 always immediately returned to the system so if the user tries to
00089 access the memory after it is freed then the handler is triggered,
00090 also.
00091
00092 The problem here is that we are able to allocate / protect only the
00093 whole page. So the user has to run the debugger twice: one time with
00094 the left alignment (#define MALLOCPROTECT <0), and then with the right
00095 alignment (#define MALLOCPROTECT >0). During the first run the possible
00096 errors like x[-1] will be caught, and the second run will manifest
00097 reading over the allocated ares.
00098
00099 The leftmost extra page is always allocated and protected. The size
00100 of the allocated chunk is stored in the beginning of this page.

4.69.1 Detailed Description

Contains the routines that write messages. This includes the very important routine MesPrint which is the FORM equivalent of printf but then with escape sequences that are relevant for symbolic manipulation. The FORM statement Print "..." is passed almost literally to MesPrint.

4.69.2 Function Documentation

4.69.2.1 Error0()

```
void Error0 (  
    char * s )
```

Definition at line 56 of file [message.c](#).

4.69.2.2 Error1()

```
void Error1 (  
    char * s,  
    UBYTE * t )
```

Definition at line 67 of file [message.c](#).

4.69.2.3 Error2()

```
void Error2 (  
    char * s1,  
    char * s2,  
    UBYTE * t )
```

Definition at line 78 of file [message.c](#).

4.69.2.4 MesWork()

```
int MesWork (
    void )
```

Definition at line 89 of file [message.c](#).

4.69.2.5 MesPrint()

```
int MesPrint (
    const char * fmt,
    ... )
```

Definition at line 136 of file [message.c](#).

4.69.2.6 Warning()

```
void Warning (
    char * s )
```

Definition at line 779 of file [message.c](#).

4.69.2.7 HighWarning()

```
void HighWarning (
    char * s )
```

Definition at line 791 of file [message.c](#).

4.69.2.8 MesCall()

```
int MesCall (
    char * s )
```

Definition at line 803 of file [message.c](#).

4.69.2.9 MesCerr()

```
int MesCerr (
    char * s,
    UBYTE * t )
```

Definition at line 813 of file [message.c](#).

4.69.2.10 MesComp()

```
int MesComp (
    char * s,
    UBYTE * p,
    UBYTE * q )
```

Definition at line [832](#) of file [message.c](#).

4.69.2.11 PrintTerm()

```
void PrintTerm (
    WORD * term,
    char * where )
```

Definition at line [846](#) of file [message.c](#).

4.69.2.12 PrintTermC()

```
void PrintTermC (
    WORD * term,
    char * where )
```

Definition at line [876](#) of file [message.c](#).

4.69.2.13 PrintSubTerm()

```
void PrintSubTerm (
    WORD * term,
    char * where )
```

Definition at line [910](#) of file [message.c](#).

4.69.2.14 PrintWords()

```
void PrintWords (
    WORD * buffer,
    LONG number )
```

Definition at line [932](#) of file [message.c](#).

4.69.2.15 PrintSeq()

```
void PrintSeq (
    WORD * a,
    char * text )
```

Definition at line [950](#) of file [message.c](#).

00100
00101     Kind of a printf function for simple messages.
00102     The main concern is getting the arguments in a portable way.
00103     Note: many compilers have errors when sizeof(WORD) < sizeof(int)
00104     %a array of size n WORDs (two parameters, first is int, second WORD *)
00105     %b array of size n UBYTES (two parameters, first is int, second UBYTE *)
00106     %C array of size n chars (two parameters, first is int, second char *)
00107     %d word;
00108     %l long;
00109     %L long long *;
00110     %s string;
00111     %#i unsigned word filled
00112     %#d word positioned
00113     %#l long word positioned.
00114     %#L long long word * positioned.
00115     %#s string positioned.
00116     %#p position in file.
00117     %r The current term in raw format (internal representation)
00118     %t The current term (AN.currentTerm)
00119     %T The current term (AN.currentTerm) with its sign
00120     %w Number of the thread(worker)
00121     %$ The next $ in AN.listinprint
00122     %x hexadecimal. Takes 8 places. Mainly for debugging.
00123     %% %
00124     %# #
00125     # " ==> "
00126     @ " ==> " Preprocessor error
00127     & ' --> ' Regular compiler error
00128     Each call is terminated with a new line.
00129     Put a % at the end of the string to suppress the new line.
00130
00131     New feature (7-dec-2011): The & will only work when we do not block it
00132     from the execution of the print statement because we need the & also for
00133     the tabulator in the print "" statement.
00134 */

4.71.1 Detailed Description

These are the low level functions for the database part of the tablebases. These routines have been copied (and then adapted) from the minos database program. This file goes together with [minos.h](#)

Definition in file [minos.c](#).

4.71.2 Macro Definition Documentation

4.71.2.1 CFD

```
#define CFD(
    y,
    s,
    type,
    x,
    j )
```

Value:

```
for(x=0, j=0; j<((int) sizeof(type)); j++) \
{ x=(x<<8)+((*(s++)&0x00FF)); } y=x;
```

Definition at line 55 of file [minos.c](#).

4.71.2.2 CTD

```
#define CTD(
    y,
    s,
    type,
    x,
    j )
```

Value:

```
x=y; for(j=sizeof(type)-1; j>=0; j--) { s[j]=x&0xFF; \
x>>=8; } s += sizeof(type);
```

Definition at line 57 of file [minos.c](#).

4.71.3 Function Documentation

4.71.3.1 minosread()

```
int minosread (
    FILE * f,
    char * buffer,
    MLONG size )
```

Definition at line 66 of file [minos.c](#).

4.71.3.2 minoswrite()

```
int minoswrite (
    FILE * f,
    char * buffer,
    MLONG size )
```

Definition at line 83 of file [minos.c](#).

4.71.3.3 str_dup()

```
char * str_dup (
    char * str )
```

Definition at line 101 of file [minos.c](#).

4.71.3.4 convertblock()

```
void convertblock (
    INDEXBLOCK * in,
    INDEXBLOCK * out,
    int mode )
```

Definition at line 120 of file [minos.c](#).

4.71.3.5 convertnamesblock()

```
void convertnamesblock (
    NAMESBLOCK * in,
    NAMESBLOCK * out,
    int mode )
```

Definition at line 171 of file [minos.c](#).

4.73.1 Detailed Description

Contains all needed declarations and definitions for the tablebase low level file routines. These have been taken from the minos database system and modified somewhat.

!!!CAUTION!!! Changes in this file will most likely have consequences for the recovery mechanism (see [checkpoint.c](#)). You need to care for the code in [checkpoint.c](#) as well and modify the code there accordingly!

00030 /* #[ License : */
00031 /*
00032 *   #[ Explanations :
00033 *
00034 *   This is a second generation much simplified version of model.c
00035 *   Syntax:
00036 *       Model QED;
00037 *           Particle electron,positron,-2;
00038 *           Particle photon,+3;
00039 *           Vertex electron,positron,photon: g;
00040 *       EndModel;
00041 *   or:
00042 *       Model QCD;
00043 *           Particle quark,antiquark,-2;
00044 *           Particle ghost,antighost,-1;
00045 *           Particle gluon,+3;
00046 *           Vertex quark,antiquark,gluon: g;
00047 *           Vertex qhost,antighost,gluon: g;
00048 *           Vertex gluon,gluon,gluon: g;
00049 *           Vertex gluon,gluon,gluon,gluon: g^2;
00050 *       EndModel;
00051 *   Remarks:
00052 *   1: if no second particle is given, a particle and its antiparticle are the same
00053 *   2: Spin statistics is by dimension of SU(2) representation with a sign.
00054 *   3: In a vertex we need to mention the coupling constants.
00055 *   4: Internally a particle gives a vertex with only two lines.
00056 *   5: All particles must have been declared before any vertex.
00057 *
00058 *   The diagrams should be provided as a collection of nodes and edges
00059 *   with momenta with a direction substituted. The other parameters (like
00060 *   Lorentz indices, color indices etc.) can then be provided in a procedure
00061 *   that should go with this mode definition.
00062 *   In principle the edges are not needed if there are no 'insertions', but
00063 *   because we would like to have the insertions as well we need the edges.
00064 *

4.77.1 Detailed Description

A number of routines that deal with the moduleoption statement and the execution of modules. Additionally there are the execution of the exec and pipe instructions.

Definition in file [module.c](#).

4.77.2 Function Documentation

4.77.2.1 ModuleInstruction()

```
int ModuleInstruction (
    int * moduletype,
    int * specialtype )
```

Definition at line 76 of file [module.c](#).

4.77.2.2 CoModuleOption()

```
int CoModuleOption (
    UBYTE * s )
```

Definition at line 143 of file [module.c](#).

4.77.2.3 CoModOption()

```
int CoModOption (
    UBYTE * s )
```

Definition at line 212 of file [module.c](#).

4.77.2.4 SetSpecialMode()

```

4.79.1 Detailed Description

MPI dependent functions of perform

This file contains all the functions for the parallel version of form3 that explicitly need to call mpi routines. This is the only file that really needs to be linked to the mpi-library!

Definition in file [mpi.c](#).

4.79.2 Macro Definition Documentation

4.79.2.1 PF_PACKSIZE

```
#define PF_PACKSIZE 1600
```

Definition at line 58 of file [mpi.c](#).

4.79.2.2 MPI_ERRCODE_CHECK

```
#define MPI_ERRCODE_CHECK(  
    err )
```

Value:

```
do { \
    int _tmp_err = (err); \
    if ( _tmp_err != MPI_SUCCESS ) return _tmp_err != 0 ? _tmp_err : -1; \
} while (0)
```

A macro which exits the caller with a non-zero return value if *err* is not MPI_SUCCESS.

Parameters

<i>err</i>	The return value of a MPI function to be checked.
------------	---

Remarks

The MPI standard defines MPI_SUCCESS == 0. Then (_tmp_err == 0) appears twice and we can expect the second evaluation will be eliminated by the compiler optimization.

Definition at line 84 of file [mpi.c](#).

4.79.3 Function Documentation

4.79.3.1 PF_RealTime()

```
LONG PF_RealTime (  
    int i )
```

Returns the realtime in 1/100 sec. as a LONG.

Parameters

<i>i</i>	the timer will be reset if <code>i == 0</code> .
----------	--

Returns

the real elapsed time in 1/100 second.

Definition at line 101 of file [mpi.c](#).

Referenced by [PF_Init\(\)](#).

4.79.3.2 PF_LibInit()

```
int PF_LibInit (
    int * argcp,
    char *** argvp )
```

Performs all library dependent initializations.

Parameters

<i>argcp</i>	pointer to the number of arguments.
<i>argvp</i>	pointer to the arguments.

Returns

0 if OK, nonzero on error.

Definition at line 123 of file [mpi.c](#).

Referenced by [PF_Init\(\)](#).

4.79.3.3 PF_LibTerminate()

```
int PF_LibTerminate (
    int error )
```

Exits mpi, when there is an error either indicated or happening, returnvalue is 1, else returnvalue is 0.

Parameters

<i>error</i>	an error code.
--------------	----------------

Returns

0 if OK, nonzero on error.

Definition at line 209 of file [mpi.c](#).

Referenced by [PF_Terminate\(\)](#).

4.79.3.4 PF_Probe()

```
int PF_Probe (
    int * src )
```

Probes the next incoming message. If `src == PF_ANY_SOURCE` this operation is blocking, otherwise nonblocking.

Parameters

<i>in, out</i>	<i>src</i>	the source process number. In output, the process number of actual found source.
----------------	------------	--

Returns

the tag value of the next incoming message if found, 0 if a nonblocking probe (input `src != PF_ANY_SOURCE`) did not find any messages. A negative returned value indicates an error.

Definition at line [230](#) of file [mpi.c](#).

4.79.3.5 PF_ISEND(buf)

```
int PF_ISEND (
    int to,
    int tag )
```

Nonblocking send operation. It sends everything from `buf` to `fill` of the active buffer. Depending on `tag` it also can do waiting for other sends to finish or set the active buffer to the next one.

Parameters

<i>to</i>	the destination process number.
<i>tag</i>	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line [261](#) of file [mpi.c](#).

Referenced by [FlushOut\(\)](#), [PF_Processor\(\)](#), and [PutOut\(\)](#).

4.79.3.6 PF_RECV(buf)

```
int PF_RECV (
    WORD * b,
    LONG * s,
    int * src )
```

Blocking receive of a `WORD` buffer.

Parameters

<i>out</i>	<i>b</i>	the buffer to store the received data.
<i>in, out</i>	<i>s</i>	the size of the buffer. The output value is the actual size of the received data.
<i>in, out</i>	<i>src</i>	the source process number. The output value is the process number of actual source.

Returns

the received message tag. A negative value indicates an error.

Definition at line 337 of file [mpi.c](#).

4.79.3.7 PF_IRecvRbuf()

```
int PF_IRecvRbuf (
    PF_BUFFER * r,
    int bn,
    int from )
```

Posts nonblocking receive for the active receive buffer. The buffer is filled from `full` to `stop`.

Parameters

<i>r</i>	the PF_BUFFER struct for the nonblocking receive.
<i>bn</i>	the index of the cyclic buffer.
<i>from</i>	the source process number.

Returns

0 if OK, nonzero on error.

Definition at line 366 of file [mpi.c](#).

4.79.3.8 PF_WaitRbuf()

```
int PF_WaitRbuf (
    PF_BUFFER * r,
    int bn,
    LONG * size )
```

Waits for the buffer *bn* to finish a pending nonblocking receive. It returns the received tag and in **size* the number of field received. If the receive is already finished, just return the flag and size, else wait for it to finish, but also check for other pending receives.

Parameters

	<i>r</i>	the PF_BUFFER struct for the pending nonblocking receive.
	<i>bn</i>	the index of the cyclic buffer.
<i>out</i>	<i>size</i>	the actual size of received data.

Returns

the received message tag. A negative value indicates an error.

Definition at line 400 of file [mpi.c](#).

4.79.3.9 PF_Bcast()

```
int PF_Bcast (
    void * buffer,
    int count )
```

Broadcasts a message from the master to slaves.

Parameters

<i>in, out</i>	<i>buffer</i>	the starting address of buffer. The contents in this buffer on the master will be transferred to those on the slaves.
	<i>count</i>	the length of the buffer in bytes.

Returns

0 if OK, nonzero on error.

Definition at line 440 of file [mpi.c](#).

Referenced by [PF_BroadcastBuffer\(\)](#), and [PF_BroadcastNumber\(\)](#).

4.79.3.10 PF_RawSend()

```
int PF_RawSend (
    int dest,
    void * buf,
    LONG l,
    int tag )
```

Sends *l* bytes from *buf* to *dest*. Returns 0 on success, or -1.

Parameters

<i>dest</i>	the destination process number.
<i>buf</i>	the send buffer.
<i>l</i>	the size of data in the send buffer in bytes.
<i>tag</i>	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line 463 of file [mpi.c](#).

Referenced by [PF_MUnlock\(\)](#), and [PF_SendFile\(\)](#).

4.79.3.11 PF_RawRecv()

```
LONG PF_RawRecv (
    int * src,
    void * buf,
    LONG thesize,
    int * tag )
```

Receives not more than *thesize* bytes from *src*, returns the actual number of received bytes, or -1 on failure.

Parameters

in, out	<i>src</i>	the source process number. In output, that of the actual received message.
out	<i>buf</i>	the receive buffer.
	<i>thesize</i>	the size of the receive buffer in bytes.
out	<i>tag</i>	the message tag of the actual received message.

Returns

the actual sizeof received data in bytes, or -1 on failure.

Definition at line [484](#) of file [mpi.c](#).

Referenced by [PF_RecvFile\(\)](#).

4.79.3.12 PF_RawProbe()

```
int PF_RawProbe (
    int * src,
    int * tag,
    int * bytesize )
```

Probes an incoming message.

Parameters

in, out	<i>src</i>	the source process number. In output, that of the actual received message.
in, out	<i>tag</i>	the message tag. In output, that of the actual received message.
out	<i>bytesize</i>	the size of incoming data in bytes.

Returns

0 if OK, nonzero on error.

Definition at line [508](#) of file [mpi.c](#).

4.79.3.13 PF_PrintPackBuf()

```
int PF_PrintPackBuf (
    char * s,
    int size )
```

Prints the contents in the pack buffer.

Parameters

<i>s</i>	a message to be shown.
<i>size</i>	the length of the buffer to be shown.

Returns

0 if OK, nonzero on error.

Definition at line 594 of file [mpi.c](#).

4.79.3.14 PF_PreparePack()

```
int PF_PreparePack (  
    void )
```

Prepares for the next pack operations on the sender.

Returns

0 if OK, nonzero on error.

Definition at line 624 of file [mpi.c](#).

Referenced by [Optimize\(\)](#), [PF_BroadcastPreDollar\(\)](#), [PF_BroadcastString\(\)](#), and [PF_Init\(\)](#).

4.79.3.15 PF_Pack()

```
int PF_Pack (  
    const void * buffer,  
    size_t count,  
    MPI_Datatype type )
```

Adds data into the pack buffer.

Parameters

<i>buffer</i>	the pointer to the buffer storing the data to be packed.
<i>count</i>	the number of elements in the buffer.
<i>type</i>	the data type of elements in the buffer.

Returns

0 if OK, nonzero on error.

Definition at line 642 of file [mpi.c](#).

References [MPI_ERRCODE_CHECK](#).

Referenced by [Optimize\(\)](#), [PF_BroadcastPreDollar\(\)](#), and [PF_Init\(\)](#).

4.79.3.16 PF_Unpack()

```
int PF_Unpack (
    void * buffer,
    size_t count,
    MPI_Datatype type )
```

Retrieves the next data in the pack buffer.

Parameters

out	<i>buffer</i>	the pointer to the buffer to store the unpacked data.
	<i>count</i>	the number of elements of data to be received.
	<i>type</i>	the data type of elements of data to be received.

Returns

0 if OK, nonzero on error.

Definition at line 671 of file [mpi.c](#).

References [MPI_ERRCODE_CHECK](#).

Referenced by [Optimize\(\)](#), [PF_BroadcastPreDollar\(\)](#), and [PF_Init\(\)](#).

4.79.3.17 PF_PackString()

```
int PF_PackString (
    const UBYTE * str )
```

Packs a string *str* into the packed buffer PF_packbuf, including the trailing zero.

The first element (PF_INT) is the length of the packed portion of the string. If the string does not fit to the buffer PF↵_packbuf, the function packs only the initial portion. It returns the number of packed bytes, so if (str[length-1]=='\0') then the whole string fits to the buffer, if not, then the rest (str+length) must be packed and send again. On error, the function returns the negative error code.

One exception: the string "\0\0" is used as an image of the NULL, so all 3 characters will be packed.

Parameters

<i>str</i>	a string to be packed.
------------	------------------------

Returns

the number of packed bytes, or a negative value on failure.

Definition at line 706 of file [mpi.c](#).

Referenced by [PF_BroadcastString\(\)](#).

4.79.3.18 PF_UnpackString()

```
int PF_UnpackString (
    UBYTE * str )
```

Unpacks a string to *str* from the packed buffer PF_packbuf, including the trailing zero.

It returns the number of unpacked bytes, so if (str[length-1]=='\0') then the whole string was unpacked, if not, then the rest must be appended to (str+length). On error, the function returns the negative error code.

Parameters

out	<i>str</i>	the buffer to store the unpacked string
-----	------------	---

Returns

the number of unpacked bytes, or a negative value on failure.

Definition at line 774 of file [mpi.c](#).

Referenced by [PF_BroadcastString\(\)](#).

4.79.3.19 PF_Send()

```
int PF_Send (
    int to,
    int tag )
```

Sends the contents in the pack buffer to the process specified by *to*.

Example:

```
if ( PF.me == SRC ) {
    PF_PreparePack();
    // Packing operations here...
    PF_Send(DEST, TAG);
}
else if ( PF.me == DEST ) {
    PF_Receive(SRC, TAG, &actual_src, &actual_tag);
    // Unpacking operations here...
}
```

Parameters

<i>to</i>	the destination process number.
<i>tag</i>	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line 822 of file [mpi.c](#).

References [MPI_ERRCODE_CHECK](#).

4.79.3.20 PF_Receive()

```
int PF_Receive (
    int src,
    int tag,
    int * psrc,
    int * ptag )
```

Receives data into the pack buffer from the process specified by *src*. This function allows &*src* == *psrc* or &*tag* == *ptag*. Either *psrc* or *ptag* can be NULL.

See the example of [PF_Send\(\)](#).

Parameters

	<i>src</i>	the source process number (can be PF_ANY_SOURCE).
	<i>tag</i>	the source message tag (can be PF_ANY_TAG).
out	<i>psrc</i>	the actual source process number of received message.
out	<i>ptag</i>	the received message tag.

Returns

0 if OK, nonzero on error.

Definition at line 848 of file [mpi.c](#).

References [MPI_ERRCODE_CHECK](#).

4.79.3.21 PF_Broadcast()

```
int PF_Broadcast (
    void )
```

Broadcasts the contents in the pack buffer on the master to those on the slaves.

Example:

```
if ( PF.me == MASTER ) {
    PF_PrepPack();
    // Packing operations here...
}
PF_Broadcast();
if ( PF.me != MASTER ) {
    // Unpacking operations here...
}
```

Returns

0 if OK, nonzero on error.

Definition at line 883 of file [mpi.c](#).

References [MPI_ERRCODE_CHECK](#).

Referenced by [Optimize\(\)](#), [PF_BroadcastPreDollar\(\)](#), [PF_BroadcastString\(\)](#), and [PF_Init\(\)](#).

4.79.3.22 PF_PrepareLongSinglePack()

```
int PF_PrepareLongSinglePack (
    void )
```

Prepares for the next long-single-pack operations on the sender.

Returns

0 if OK, nonzero on error.

Definition at line 1451 of file [mpi.c](#).

Referenced by [PF_CollectModifiedDollars\(\)](#), and [PF_Processor\(\)](#).

4.79.3.23 PF_LongSinglePack()

```
int PF_LongSinglePack (
    const void * buffer,
    size_t count,
    MPI_Datatype type )
```

Adds data into the "long single" pack buffer.

Parameters

<i>buffer</i>	the pointer to the buffer storing the data to be packed.
<i>count</i>	the number of elements in the buffer.
<i>type</i>	the data type of elements in the buffer.

Returns

0 if OK, nonzero on error.

Definition at line 1469 of file [mpi.c](#).

Referenced by [PF_CollectModifiedDollars\(\)](#), and [PF_Processor\(\)](#).

4.79.3.24 PF_LongSingleUnpack()

```
int PF_LongSingleUnpack (
    void * buffer,
    size_t count,
    MPI_Datatype type )
```

Retrieves the next data in the "long single" pack buffer.

Parameters

out	<i>buffer</i>	the pointer to the buffer to store the unpacked data.
	<i>count</i>	the number of elements of data to be received.
	<i>type</i>	the data type of elements of data to be received.

Returns

0 if OK, nonzero on error.

Definition at line 1503 of file [mpi.c](#).

Referenced by [PF_CollectModifiedDollars\(\)](#), and [PF_Processor\(\)](#).

4.79.3.25 PF_LongSingleSend()

```
int PF_LongSingleSend (
    int to,
    int tag )
```

Sends the contents in the "long single" pack buffer to the process specified by *to*.

Example:

```
if ( PF.me == SRC ) {
    PF_PrepareLongSinglePack();
    // Packing operations here...
    PF_LongSingleSend(DEST, TAG);
}
else if ( PF.me == DEST ) {
    PF_LongSingleReceive(SRC, TAG, &actual_src, &actual_tag);
    // Unpacking operations here...
}
```

Parameters

<i>to</i>	the destination process number.
<i>tag</i>	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line 1540 of file [mpi.c](#).

Referenced by [PF_CollectModifiedDollars\(\)](#), and [PF_Processor\(\)](#).

4.79.3.26 PF_LongSingleReceive()

```
int PF_LongSingleReceive (
    int src,
    int tag,
    int * psrc,
    int * ptag )
```

Receives data into the "long single" pack buffer from the process specified by *src*. This function allows *&src == psrc* or *&tag == ptag*. Either *psrc* or *ptag* can be NULL.

See the example of [PF_LongSingleSend\(\)](#).

Parameters

	<i>src</i>	the source process number (can be PF_ANY_SOURCE).
	<i>tag</i>	the source message tag (can be PF_ANY_TAG).
out	<i>psrc</i>	the actual source process number of received message.
out	<i>ptag</i>	the received message tag.

Returns

0 if OK, nonzero on error.

Definition at line 1583 of file [mpi.c](#).

Referenced by [PF_CollectModifiedDollars\(\)](#), and [PF_Processor\(\)](#).

4.79.3.27 PF_PrepareLongMultiPack()

```
int PF_PrepareLongMultiPack (
    void )
```

Prepares for the next long-multi-pack operations on the sender.

Returns

0 if OK, nonzero on error.

Definition at line 1643 of file [mpi.c](#).

Referenced by [Optimize\(\)](#), [PF_BroadcastCBuf\(\)](#), [PF_BroadcastExpFlags\(\)](#), [PF_BroadcastModifiedDollars\(\)](#), and [PF_BroadcastRedefinedPreVars\(\)](#).

4.79.3.28 PF_LongMultiPackImpl()

```
int PF_LongMultiPackImpl (
    const void * buffer,
    size_t count,
    size_t eSize,
    MPI_Datatype type )
```

Adds data into the "long multi" pack buffer.

Parameters

<i>buffer</i>	the pointer to the buffer storing the data to be packed.
<i>count</i>	the number of elements in the buffer.
<i>eSize</i>	the byte size of each element of data.
<i>type</i>	the data type of elements in the buffer.

Returns

0 if OK, nonzero on error.

Definition at line 1662 of file [mpi.c](#).

References [PF_LongMultiPackImpl\(\)](#).

Referenced by [PF_LongMultiPackImpl\(\)](#).

Here is the call graph for this function:

**4.79.3.29 PF_LongMultiUnpackImpl()**

```
int PF_LongMultiUnpackImpl (
    void * buffer,
    size_t count,
    size_t eSize,
    MPI_Datatype type )
```

Retrieves the next data in the "long multi" pack buffer.

Parameters

out	<i>buffer</i>	the pointer to the buffer to store the unpacked data.
	<i>count</i>	the number of elements of data to be received.
	<i>eSize</i>	the byte size of each element of data.
	<i>type</i>	the data type of elements of data to be received.

Returns

0 if OK, nonzero on error.

Definition at line 1721 of file [mpi.c](#).

Here is the call graph for this function:

4.79.3.30 PF_LongMultiBroadcast()

```
int PF_LongMultiBroadcast (
    void )
```

Broadcasts the contents in the "long multi" pack buffer on the master to those on the slaves.

Example:

```
if ( PF.me == MASTER ) {
    PF_PrepareLongMultiPack();
    // Packing operations here...
}
PF_LongMultiBroadcast();
if ( PF.me != MASTER ) {
    // Unpacking operations here...
}
```

Returns

0 if OK, nonzero on error.

00912     #] The pack buffer :
00913     #[ Long pack stuff :
00914     #[ Explanations :
00915
00916     The problems here are:
00917     1. We need to send/receive long dollar variables. For
00918     preprocessor-defined dollarvars we used multiply
00919     packing/broadcasting (see parallel.c:PF_BroadcastPreDollar())
00920     since each variable must be broadcast immediately. For run-time
00921     the changed dollar variables, collecting and broadcasting are
00922     performed at the end of the module and all modified dollarvars
00923     are transferred "at once", that is why the size of packed and
00924     transferred buffers may be really very large.
00925     2. There is some strange feature of MPI_Bcast() on Altix MPI
00926     implementation, namely, sometimes it silently fails with big
00927     buffers. For better performance, it would be useful to send one
00928     big buffer instead of several small ones (since the latency is more
00929     important than the bandwidth). That is why we need two different
00930     sets of routines: for long point-to-point communication we collect
00931     big re-allocatable buffer, the corresponding routines have the
00932     prefix PF_longSingle, and for broadcasting we pack data into
00933     several smaller buffers, the corresponding routines have the
00934     prefix PF_longMulti.
00935     Note, from portability reasons we cannot split large packed

```

```

00936     buffer into small chunks, send them and collect back on the other
00937     side, see "Advice to users" on page 180 MPI--The Complete Reference
00938     Volume1, second edition.
00939     OPTIMIZING:
00940     We assume, for most communications, the single buffer of size
00941     PF_packsize is enough.
00942
00943     How does it work:
00944     For point-to-point, there is one big re-allocatable
00945     buffer PF_longPackBuf with two integer positions: PF_longPackPos
00946     and PF_longPackTop (due to re-allocatable character of the buffer,
00947     it is better to use integers rather than pointers).
00948     Each time of re-allocation, the size of the buffer
00949     PF_longPackBuf is incremented by the same size of a "standard" chunk
00950     PF_packsize.
00951     For broadcasting there is one linked list (PF_longMultiRoot),
00952     which contains either positions of a chunk of PF_longPackBuf, or
00953     it's own buffer. This is done for better memory utilisation:
00954     longSingle and longMulti are never used simultaneously.
00955     When a new cell is needed for longMulti packing, we increment
00956     the counter PF_longPackN and just follow the list. If it is not
00957     possible, we allocate the cell's own buffer and link it to the end
00958     of the list PF_longMultiRoot.
00959     When PF_longPackPos is reallocated, we link new chunks into
00960     existing PF_longMultiRoot list before the first longMulti allocated
00961     cell's own buffer. The pointer PF_longMultiLastChunk points to the last
00962     cell of PF_longMultiRoot containing the pointer to the chunk of
00963     PF_longPackBuf.
00964     Initialization PF_longPackBuf is made by the function
00965     PF_longSingleReset(). In the begin of the PF_longPackBuf it packs
00966     the size of the last sent buffer. Upon sending, the program checks,
00967     whether there was at list one re-allocation (PF_longPackN>1) .
00968     If so, the sender first packs and sends small buffer
00969     (PF_longPackSmallBuf) containing one integer number -- the
00970     _negative_ new size of the send buffer. Getting the buffer, a
00971     receiver unpacks one integer and checks whether it is <0 . If so,
00972     the receiver will repeat receiving, but first it checks whether
00973     it has enough buffer and increase it, if necessary.
00974     Initialization PF_longMultiRoot is made by the function
00975     PF_longMultiReset(). In the begin of the first chunk it packs
00976     one integer -- the number 1. Upon sending, the program checks,
00977     how many cells were packed (PF_longPackN). If more than 1, the
00978     sender packs to the next cell the integer PF_longPackN, than
00979     packs PF_longPackN pairs of integers -- the information about how many
00980     times chunk on each cell was accessed by the packing procedure,
00981     this information is contained by the nPacks field of the cell
00982     structure, and how many non-complete items was at the end of this
00983     chunk the structure field lastLen. Then the sender sends first
00984     this auxiliary chunk.
00985     The receiver unpacks the integer from obtained chunk and, if this
00986     integer is more than 1, it gets more chunks, unpacking information
00987     from the first auxiliary chunk into the corresponding nPacks
00988     fields. Unpacking information from multiple chunks, the receiver
00989     knows, when the chunk is expired and it must switch to the next cell,
00990     successively decrementing corresponding nPacks field.
00991
00992     XXX: There are still some flaws:
00993     PF_LongSingleSend/PF_LongSingleReceive may fail, for example, for data
00994     transfers from the master to many slaves. Suppose that the master sends big
00995     data to slaves, which needs an increase of the buffer of the receivers. For
00996     the first data transfer, the master sends the new buffer size as the first
00997     message, and then sends the data as the second message, because
00998     PF_LongSinglePack records the increase of the buffer size on the master. For
00999     the next time, however, the master sends the data without sending the new
01000     buffer size, and then MPI_Recv fails due to the data overflow.
01001     In parallel.c, they are used for the communication from slaves to the
01002     master. In this case, this problem does not occur because the master always
01003     has enough buffer.
01004     The maximum size that PF_LongMultiBroadcast can broadcast is limited to
01005     around 320kB because the current implementation tries to pack all
01006     information of chained buffers into one buffer, whose size is PF_packsize
01007     = 1600B.

4.85.1 Detailed Description

The complete names administration. All variables with a name have to pass here to be properly registered, have structs of the proper type assigned to them etc. The file also contains the utility routines for maintaining the balanced trees that make searching for names rather fast.

Definition in file [names.c](#).

4.85.2 Function Documentation

4.85.2.1 GetNode()

```
NAMENODE * GetNode (
    NAMETREE * nametree,
    UBYTE * name )
```

Definition at line 49 of file [names.c](#).

4.85.2.2 AddName()

```
int AddName (
    NAMETREE * nametree,
    UBYTE * name,
    WORD type,
    WORD number,
    int * nodenum )
```

Definition at line 71 of file [names.c](#).

4.85.2.3 GetName()

```
int GetName (
    NAMETREE * nametree,
    UBYTE * namein,
    WORD * number,
    int par )
```

Definition at line 252 of file [names.c](#).

4.85.2.4 GetFunction()

```
UBYTE * GetFunction (
    UBYTE * s,
    WORD * funnum )
```

Definition at line 342 of file [names.c](#).

4.85.2.5 GetNumber()

```
UBYTE * GetNumber (
    UBYTE * s,
    WORD * num )
```

Definition at line 388 of file [names.c](#).

4.85.2.6 GetLastExprName()

```
int GetLastExprName (
    UBYTE * name,
    WORD * number )
```

Definition at line [438](#) of file [names.c](#).

4.85.2.7 GetOName()

```
int GetOName (
    NAMETREE * nametree,
    UBYTE * name,
    WORD * number,
    int par )
```

Definition at line [460](#) of file [names.c](#).

4.85.2.8 GetAutoName()

```
int GetAutoName (
    UBYTE * name,
    WORD * number )
```

Definition at line [479](#) of file [names.c](#).

4.85.2.9 GetVar()

```
int GetVar (
    UBYTE * name,
    WORD * type,
    WORD * number,
    int wantedtype,
    int par )
```

Definition at line [524](#) of file [names.c](#).

4.85.2.10 EntVar()

```
int EntVar (
    WORD type,
    UBYTE * name,
    WORD x,
    WORD y,
    WORD z,
    WORD d )
```

Definition at line [557](#) of file [names.c](#).

4.85.2.11 GetDollar()

```
int GetDollar (
    UBYTE * name )
```

Definition at line 590 of file [names.c](#).

4.85.2.12 DumpTree()

```
void DumpTree (
    NAMETREE * nametree )
```

Definition at line 602 of file [names.c](#).

4.85.2.13 DumpNode()

```
void DumpNode (
    NAMETREE * nametree,
    WORD node,
    WORD depth )
```

Definition at line 615 of file [names.c](#).

4.85.2.14 CompactifyTree()

```
int CompactifyTree (
    NAMETREE * nametree,
    WORD par )
```

Definition at line 634 of file [names.c](#).

4.85.2.15 CopyTree()

```
void CopyTree (
    NAMETREE * newtree,
    NAMETREE * oldtree,
    WORD node,
    WORD par )
```

Definition at line 696 of file [names.c](#).

4.85.2.16 LinkTree()

```
void LinkTree (
    NAMETREE * tree,
    WORD offset,
    WORD numnodes )
```

Definition at line 784 of file [names.c](#).

4.85.2.17 MakeNameTree()

```
NAMETREE * MakeNameTree (
    void )
```

Definition at line 815 of file [names.c](#).

4.85.2.18 FreeNameTree()

```
void FreeNameTree (
    NAMETREE * n )
```

Definition at line 834 of file [names.c](#).

4.85.2.19 ClearWildcardNames()

```
void ClearWildcardNames (
    void )
```

Definition at line 849 of file [names.c](#).

4.85.2.20 AddWildcardName()

```
int AddWildcardName (
    UBYTE * name )
```

Definition at line 854 of file [names.c](#).

4.85.2.21 GetWildcardName()

```
int GetWildcardName (
    UBYTE * name )
```

Definition at line 898 of file [names.c](#).

4.85.2.22 AddSymbol()

```
int AddSymbol (
    UBYTE * name,
    int minpow,
    int maxpow,
    int cplx,
    int dim )
```

Definition at line 920 of file [names.c](#).

4.85.2.23 CoSymbol()

```
int CoSymbol (
    UBYTE * s )
```

Definition at line 946 of file [names.c](#).

4.85.2.24 AddIndex()

```
int AddIndex (
    UBYTE * name,
    int dim,
    int dim4 )
```

Definition at line 1088 of file [names.c](#).

4.85.2.25 CoIndex()

```
int CoIndex (
    UBYTE * s )
```

Definition at line 1112 of file [names.c](#).

4.85.2.26 DoDimension()

```
UBYTE * DoDimension (
    UBYTE * s,
    int * dim,
    int * dim4 )
```

Definition at line 1160 of file [names.c](#).

4.85.2.27 CoDimension()

```
int CoDimension (
    UBYTE * s )
```

Definition at line 1226 of file [names.c](#).

4.85.2.28 AddVector()

```
int AddVector (
    UBYTE * name,
    int cplx,
    int dim )
```

Definition at line 1244 of file [names.c](#).

4.85.2.29 CoVector()

```
int CoVector (
    UBYTE * s )
```

Definition at line 1267 of file [names.c](#).

4.85.2.30 AddFunction()

```
int AddFunction (
    UBYTE * name,
    int comm,
    int istensor,
    int cplx,
    int symprop,
    int dim,
    int argmax,
    int argmin )
```

Definition at line 1326 of file [names.c](#).

4.85.2.31 CoCommuteInSet()

```
int CoCommuteInSet (
    UBYTE * s )
```

Definition at line 1356 of file [names.c](#).

4.85.2.32 CoFunction()

```
int CoFunction (
    UBYTE * s,
    int comm,
    int istensor )
```

Definition at line 1446 of file [names.c](#).

4.85.2.33 CoNFunction()

```
int CoNFunction (
    UBYTE * s )
```

Definition at line 1626 of file [names.c](#).

4.85.2.34 CoCFunction()

```
int CoCFunction (
    UBYTE * s )
```

Definition at line 1627 of file [names.c](#).

4.85.2.35 CoNTensor()

```
int CoNTensor (
    UBYTE * s )
```

Definition at line 1628 of file [names.c](#).

4.85.2.36 CoCTensor()

```
int CoCTensor (
    UBYTE * s )
```

Definition at line 1629 of file [names.c](#).

4.85.2.37 DoTable()

```
int DoTable (
    UBYTE * s,
    int par )
```

Definition at line 1668 of file [names.c](#).

4.85.2.38 CoTable()

```
int CoTable (
    UBYTE * s )
```

Definition at line 2050 of file [names.c](#).

4.85.2.39 CoNTable()

```
int CoNTable (
    UBYTE * s )
```

Definition at line 2060 of file [names.c](#).

4.85.2.40 CoCTable()

```
int CoCTable (
    UBYTE * s )
```

Definition at line 2070 of file [names.c](#).

4.85.2.41 EmptyTable()

```
void EmptyTable (
    TABLES T )
```

Definition at line 2080 of file [names.c](#).

4.85.2.42 AddSet()

```
int AddSet (
    UBYTE * name,
    WORD dim )
```

Definition at line [2124](#) of file [names.c](#).

4.85.2.43 DoElements()

```
int DoElements (
    UBYTE * s,
    SETS set,
    UBYTE * name )
```

Definition at line [2157](#) of file [names.c](#).

4.85.2.44 CoSet()

```
int CoSet (
    UBYTE * s )
```

Definition at line [2357](#) of file [names.c](#).

4.85.2.45 DoTempSet()

```
int DoTempSet (
    UBYTE * from,
    UBYTE * to )
```

Definition at line [2482](#) of file [names.c](#).

4.85.2.46 CoAuto()

```
int CoAuto (
    UBYTE * inp )
```

Definition at line [2574](#) of file [names.c](#).

4.85.2.47 AddDollar()

```
int AddDollar (
    UBYTE * name,
    WORD type,
    WORD * start,
    LONG size )
```

Definition at line [2604](#) of file [names.c](#).

4.85.2.48 ReplaceDollar()

```
int ReplaceDollar (
    WORD number,
    WORD newtype,
    WORD * newstart,
    LONG newsize )
```

Definition at line [2648](#) of file [names.c](#).

4.85.2.49 AddDubious()

```
int AddDubious (
    UBYTE * name )
```

Definition at line [2681](#) of file [names.c](#).

4.85.2.50 MakeDubious()

```
int MakeDubious (
    NAMETREE * nametree,
    UBYTE * name,
    WORD * number )
```

Definition at line [2695](#) of file [names.c](#).

01630
01631 /*
01632 #] CoFunction + ...:
01633 #[ DoTable :
01634
01635 Syntax:
01636 Table [check] [strict|relax] [zerofill] name(:1:2,...,regular arguments);
01637 name must be the name of a regular function.
01638 the table indices must be the first arguments.
01639 The parenthesis indicates 'name' as opposed to the options.
01640
01641 We leave behind:
01642 a struct tabl in the FUNCTION struct
01643 Regular table:
01644     an array tablepointers for the pointers to elements of rhs
01645     in the compiler struct cbuf[T->bufnum]
01646     an array MINMAX T->mm with the minima and maxima
01647     a prototype array
01648     an offset in the compiler buffer for the pattern to be matched
01649 Sparse table:
01650     Just the number of dimensions
01651     We will keep track of the number of defined elements in totind
01652     and in tablepointers we will have numind+1 positions for each
01653     element. The first numind elements for the indices and the
01654     last one for the element in cbuf[T->bufnum].rhs
01655
01656     If the number of dimensions is *<number>, there is not a fixed
01657     number of dimensions. Just a maximum. In that case the first
01658     index should be the number of other dimensions. This first index
01659     does not count in <number>.
01660
01661 Complication: to preserve speed we need a prototype and a pattern
01662 for each thread when we use WITHPTHREADS. This is because we write
01663 into those when looking for the pattern.

4.87.1 Detailed Description

Mainly the routine Normalize. This routine brings terms to standard FORM. Currently it has one serious drawback. Its buffers are all in the stack. This means these buffers have a fixed size (NORMSIZE). In the past this has caused problems and NORMSIZE had to be increased.

It is not clear whether Normalize can be called recursively.

```

Definition at line [5134](#) of file [normal.c](#).

4.87.3.13 SymbolNormalize()

```
int SymbolNormalize (
    WORD * term )
```

Routine normalizes terms that contain only symbols. Regular minimum and maximum properties are ignored.

We check whether there are negative powers in the output. This is not allowed.

4.89.1 Detailed Description

Contains the functions that deal with the rewriting and manipulation of expressions/terms in polynomial representation.

Definition in file [notation.c](#).

4.89.2 Function Documentation

4.89.2.1 NormPolyTerm()

```
int NormPolyTerm (
    PHEAD WORD * term )
```

Definition at line 53 of file [notation.c](#).

4.89.2.2 ConvertToPoly()

```
int ConvertToPoly (
    PHEAD WORD * term,
    WORD * outterm,
    WORD * comlist,
    WORD par )
```

Definition at line 307 of file [notation.c](#).

4.89.2.3 LocalConvertToPoly()

```
int LocalConvertToPoly (
    PHEAD WORD * term,
    WORD * outterm,
    WORD startebuf,
    WORD par )
```

Converts a generic term to polynomial notation in which there are only symbols and brackets. During conversion there will be only symbols. Brackets are stripped. Objects that need 'translation' are put inside a special compiler buffer and represented by a symbol. The numbering of the extra symbols is down from the maximum. In principle there can be a problem when running into the already assigned ones. This uses the FindTree for searching in the global tree and then looks further in the AT.ebufnum. This allows fully parallel processing. Hence we need no locks. Cannot be used in the same module as ConvertToPoly.

Definition at line 510 of file [notation.c](#).

Referenced by [poly_factorize_expression\(\)](#).

4.89.2.4 ConvertFromPoly()

```
int ConvertFromPoly (
    PHEAD WORD * term,
    WORD * outterm,
    WORD from,
    WORD to,
    WORD offset,
    WORD par )
```

Definition at line 660 of file [notation.c](#).

4.89.2.5 FindSubterm()

```
int FindSubterm (
    WORD * subterm )
```

Definition at line 773 of file [notation.c](#).

4.89.2.6 FindLocalSubterm()

```
int FindLocalSubterm (
    PHEAD WORD * subterm,
    WORD startebuf )
```

Definition at line 843 of file [notation.c](#).

4.89.2.7 PrintSubtermList()

```
void PrintSubtermList (
    int from,
    int to )
```

Definition at line 897 of file [notation.c](#).

4.89.2.8 PrintExtraSymbol()

```
void PrintExtraSymbol (
    int num,
    WORD * terms,
    int par )
```

Definition at line 1009 of file [notation.c](#).

4.89.2.9 FindSubexpression()

```
int FindSubexpression (
    WORD * subexpr )
```

Definition at line 1096 of file [notation.c](#).

4.89.2.10 ExtraSymFun()

```
int ExtraSymFun (
    PHEAD WORD * term,
    WORD level )
```

Definition at line 1149 of file [notation.c](#).

4.89.2.11 PruneExtraSymbols()

```
int PruneExtraSymbols (
    WORD downto )
```

Definition at line 1217 of file [notation.c](#).

4.90 notation.c
